## **CERTIFICATION TEST**

- [CertificationTest.net](https://CertificationTest.net) - Cheap & Quality Resources With Best Support

Given:

```
class Product {
    double price;
}

public class Test {
    public void updatePrice(Product product, double price) {
        price = price * 2;
        product.price = product.price + price;
    }
    public static void main(String[] args) {
        Product prt = new Product();
        prt.price = 200;
        double newPrice = 100;

        Test t = new Test();
        t.updatePrice(prt, newPrice);
        System.out.println(prt.price + " : " + newPrice);
    }
}
```

What is the result?

- A. 200.0 : 100.0
- B. 400.0 : 200.0
- C. 400.0 : 100.0
- D. Compilation fails.

Exception in thread "main" java.time.temporal.UnsupportedTemporalTypeException: Unsupported field: HourOfDay  
upvoted 1 times

  **nuray** 1 year, 4 months ago

**Selected Answer: D**

The Problem

LocalDate.parse("2014-05-04") correctly parses the string into a LocalDate object representing May 4, 2014.

However, when you try to format this `LocalDate` with `DateTimeFormatter.ISO_DATE_TIME`, it throws an error because `ISO_DATE_TIME` expects both date and time components, but `LocalDate` only contains date information.

upvoted 1 times

🗨️ **Dibya17** 1 year, 5 months ago

Correct answer is D as both date and time is required but here only date is provided

upvoted 1 times

🗨️ **fvelazqueznavia** 1 year, 8 months ago

**Selected Answer: D**

D is the correct

upvoted 1 times

🗨️ **gg7495** 1 year, 9 months ago

Correct Answer is (d)

Exception is thrown as datetime formatter requires both date and time and only date is being provided here.

It will work fine if below is the input

String date = `LocalDate.parse("2014-05-04").format(DateTimeFormatter.ISO_DATE);`

Given the code fragment:

```
public static void main(String[] args) {  
    short s1 = 200;  
    Integer s2 = 400;  
    Long s3 = (long) s1 + s2;           //line n1  
    String s4 = (String) (s3 * s2);     //line n2  
    System.out.println("Sum is " + s4);  
}
```

What is the result?

- A. Sum is 600
- B. Compilation fails at line n1.
- C. Compilation fails at line n2.
- D. A ClassCastException is thrown at line n1.
- E. A ClassCastException is thrown at line n2.

**Suggested Answer: C**

Community vote distribution

C (100%)

 **theCloudCTO** Highly Voted 5 years, 3 months ago

C.

This is a casting issue but the code fails to compile so the answer is c.

The ClassCastException is a runtime exception where you're trying to cast an object to a different object type, but here the code fails to compile because you cannot cast a long to a string.

What is the name of the Java concept that uses access modifiers to protect variables and hide them within a class?

- A. Encapsulation
- B. Inheritance
- C. Abstraction
- D. Instantiation
- E. Polymorphism

**Suggested Answer: A**

Using the private modifier is the main way that an object encapsulates itself and hide data from the outside world.

  **Gyzmou** 3 years, 11 months ago

correct

upvoted 2 times

Given the code fragment:

```
abstract class Planet {
    protected void revolve() {           //line n1
    }

    abstract void rotate();              //line n2
}

class Earth extends Planet {
    void revolve() {                     //line n3
    }

    protected void rotate() {           //line n4
    }
}
```

Which two modifications, made independently, enable the code to compile? (Choose two.)

- A. Make the method at line n1 public.
- B. Make the method at line n2 public.
- C. Make the method at line n3 public.
- D. Make the method at line n3 protected.
- E. Make the method at line n4 public.

**Suggested Answer: CD**

Community vote distribution

CD (100%)

🗳️ 👤 **Ancient1** Highly Voted 2 years, 9 months ago

C, D

Cannot reduce the visibility of the inherited method from an abstract class.

In this case, can't change resolve from

protected > default

But you can change it to

protected > protected

protected > public

upvoted 9 times

🗳️ 👤 **KarreRavi** Most Recent 3 months, 3 weeks ago

**Selected Answer: AB**

Answer A and B

upvoted 1 times

🗳️ 👤 **Esau11** 4 months, 2 weeks ago

**Selected Answer: CE**

Actually, I need to revise my previous answer. The correct combination is C and E.

Because:

Earth's revolve() (line n3) has default access but inherits from protected access in Planet - it needs to be made at least protected (option D) or public (option C)

Earth's rotate() (line n4) is implementing an abstract method with default access - it needs to be made public (option E) as it can't be more restrictive than the parent's access level

Therefore my final answer is C and E - Make line n3 public and line n4 public.

upvoted 1 times

🗳️ 👤 **Esau11** 4 months, 2 weeks ago

**Selected Answer: DE**

We need TWO modifications that would allow compilation. The valid combinations are:

- D and E would work together - Making Earth's `revolve()` protected to match parent, and making `rotate()` public to be accessible.
- C and E would work together - Making both Earth methods public would satisfy all access requirements.

Therefore, the two modifications that would enable the code to compile are:

D. Make the method at line n3 protected

AND

E. Make the method at line n4 public

upvoted 1 times

🗳️ 👤 **jp\_ofi** 5 months, 1 week ago

**Selected Answer: D**

default has more visibility than protected

upvoted 1 times

🗳️ 👤 **vic88** 9 months, 1 week ago

'`revolve()`' in 'Earth' clashes with '`revolve()`' in 'Planet'; attempting to assign weaker access privileges ('package-private'); was 'protected'. Change `revolve()` public or protected.

upvoted 1 times

🗳️ 👤 **swgreen** 10 months, 1 week ago

Answer: C or D.

Compilation Error: Cannot reduce the visibility of the inherited method from Parent.

Solution: Make `Earth.revolve()` from default to protected/public.

The order from least to most visible is: `private` < `'default'` < `protected` < `public`.

Code:

```
abstract class Parent {  
    protected void revolve() {} // n1  
    abstract void rotate(); // n2  
}  
  
class Earth extends Parent {  
    void revolve() {} // n3  
    protected void rotate() {} // n4  
}
```

Answer C, D

upvoted 1 times

🗳️ 👤 **DarGrin** 1 year, 8 months ago

I see hier 3 correct answers: C,D,E! E is correct too, because method `rotate()` can be public. I have tested it!

upvoted 2 times

🗳️ 👤 **Ondo** 1 year, 9 months ago

réponse A et E

upvoted 1 times

🗳️ 👤 **gg7495** 1 year, 9 months ago

The correct answer is C and D as

the overridden method in child class should be as least as accessible as the parent class method. Thus. by making it public and protected it will be more / same accessible as parent class method.

upvoted 1 times

🗳️ 👤 **Vicky\_65** 2 years, 3 months ago

**Selected Answer: CD**

Because for method overriding the method which is overriding should be as accessible as than the overridden method

upvoted 1 times

🗳️ 👤 **Ankit1010** 2 years, 4 months ago

Correct answers are C, D.

We only have to make changes in //line n3

Either we have to keep it the same as protected or we can widen the scope to public.

private < (default) < protected < public

//line n4 is already correct because the scope was widen from (default) to protected.

upvoted 2 times

  **haisaco** 2 years, 6 months ago

CE. protected line 4 can be change to public.

D: protected = protected

upvoted 1 times

Given:

```
class Vehicle {
    String type = "4W";
    int maxSpeed = 100;

    Vehicle(String type, int maxSpeed) {
        this.type = type;
        this.maxSpeed = maxSpeed;
    }
    Vehicle() {}
}

class Car extends Vehicle {
    String trans;

    Car(String trans) {           //line n1
        this.trans = trans;
    }

    Car(String type, int maxSpeed, String trans) {
        super(type, maxSpeed);    // line n2
        this.trans = trans;
    }
}
```

And given the code fragment:

```
7. Car c1 = new Car("Auto");
8. Car c2 = new Car("4W", 150, "Manual");
9. System.out.println(c1.type + " " + c1.maxSpeed + " " + c1.trans);
10. System.out.println(c2.type + " " + c2.maxSpeed + " " + c2.trans);
```

What is the result?

- A. 4W 100 Auto 4W 150 Manual
- B. null 0 Auto 4W 150 Manual
- C. Compilation fails only at line n1
- D. Compilation fails only at line n2
- E. Compilation fails at both line n1 and line n2

Answer is A

upvoted 1 times

🗲️ 👤 **Ancient1** 2 years, 9 months ago

**Selected Answer: A**

Answer: A

Tested: Yes

Notes: No issue of compilation in this case. Both c1 and c2 are calling super constructors (c1 is using an implicit call), which are defined properly.

upvoted 2 times

Given:

```
class Caller {
    private void init () {
        System.out.println("Initialized");
    }

    private void start () {
        init();
        System.out.println("Started");
    }
}

public class TestCall {
    public static void main(String[] args) {
        Caller c = new Caller();
        c.start(); // line n1
        c.init();  // line n2
    }
}
```

What is the result?

- A. Compilation fails at line n1.
- B. Initialized Started Initialized
- C. Initialized Started
- D. Compilation fails at line n2.

**Suggested Answer: A**

Community vote distribution

**Hirushi** Highly Voted 2 years, 7 months ago

```
class Caller{
public void init() {
//private void init() {
System.out.println("Initialized");
}
```

```
public void start(){
//private void start(){
init();
System.out.println("Started");
}
}
```

```
class TestCall{
public static void main(String[] args){
Caller c = new Caller();
c.start();
c.init();
}
}
```

Answer is A and D(bcz init and start are private methods). If both public answer will be B(Initialized Started Initialized)

  **carloswork** 2 years, 8 months ago

**Selected Answer: A**

Answer is A. Tested.

upvoted 1 times

  **RoxyFoxy** 2 years, 9 months ago

**Selected Answer: A**

Compilation fails at line n1 because start() has private access in Caller class. "Caller" class IS NOT an inner class because it can be seen from the code block in which the class is declared and IS NOT at the member level of the class TestCall (that is, at the same level as the instance variables, constructors, or methods).

upvoted 2 times

Given these two classes:

```
public class Customer {
    ElectricAccount acct = new ElectricAccount();

    public void useElectricity(double kWh) {
        acct.addKWh(kWh);
    }
}

public class ElectricAccount {
    private double kWh;
    private double rate = 0.07;
    private double bill;

    //line n1
}
```

Any amount of electricity used by a customer (represented by an instance of the Customer class) must contribute to the customer's bill (represented by the member variable bill) through the useElectricity method.

An instance of the Customer class should never be able to tamper with or decrease the value of the member variable bill.

How should you write methods in the ElectricAccount class at line n1 so that the member variable bill is always equal to the value of the member variable kWh multiplied by the member variable rate?

A.

```
public void addKWh(double kWh) {
    this.kWh += kWh;
    this.bill = this.kWh*this.rate;
}
```

B.

```
public void addKWh(double kWh) {
    if (kWh > 0) {
        this.kWh += kWh;
        this.bill = this.kWh * this.rate;
    }
}
```

C.

```
private void addKWh(double kWh) {
    if (kWh > 0) {
        this.kWh += kWh;
        this.bill = this.kWh*this.rate;
    }
}
```

D.

```
public void addKWh(double kWh) {
    if(kWh > 0) {
        this.kWh += kWh;
        setBill(this.kWh);
    }
}

public void setBill(double kWh) {
    bill = kWh*rate;
}
```

**Suggested Answer: A**

 **Vicky\_65** Highly Voted 2 years, 3 months ago

Answer is B

upvoted 11 times

 **Hirushi** Highly Voted 2 years, 7 months ago

Here, both A and B give the correct answer and the only difference is, when we put the minus(-) value to useElectricity() method, A will calculate the bill and provide the negative answer.

B always calculates bill as 0.0.

I also think B is the answer the first time. because it validates the Kwh and also compiles successfully. Doesn't tamper with the bill variable as well.

But I have another confusing point, In question last line saying like this,

"member variable bill is always equal to the value of the member variable kwh multiplied by the member variable rate?"

Here, it says member variable always equal to the value of the member variable kwh multiplied by the member variable rate.

So, I have a point answer is A.

can anyone explain this? my point is valid or not???

upvoted 5 times

🗳️ 👤 **MPignaProTech** Most Recent 8 months, 2 weeks ago

You must check positif value: B

upvoted 1 times

🗳️ 👤 **The\_Java\_Champion** 6 months, 2 weeks ago

You would be correct if the condition was `if(kWh >= 0)`

but since they are checking if kWh is strictly greater than 0 `kWh > 0` then its value will never be increased. Because when you first create an Instance of `ElectricAccount`, The kWh variable is not initialized and set to 0 by default . So when you call the `addKWh` method it will always find that kWh is 0 inside the if the statement and 0 is not strictly greater than 0 so the code inside the if statement is ignored and you are always stuck with the same 0 value.

Answer is B.

A may output negative

B.

C will compile error (Cannot call private)

D, the `setBill` can be called by customer (Check line 2 of the rule)

Credits to Hirushi

upvoted 2 times

🗳️ 👤 **mbns** 1 year, 11 months ago

The correct answer is C. All other methods are public. The method must be private that the customer can not change it

upvoted 1 times

🗳️ 👤 **tawa\_z58** 1 year, 6 months ago

then how can that method be called from the customer class since we need to call it. if we want the customer not to change, we have to make sure that all our implementations are not giving the customer access to changing the bill by either going up or down. making the kWh method private will cause an error as the method wont be visible in the Customer class.

Anyone know the exact correct answer?

upvoted 1 times

  **Def8** 2 years, 8 months ago

Correct answer is B as it validates the Kwh and also compiles successfully. Doesn't tamper with the bill variable as well.

upvoted 1 times

  **carloswork** 2 years, 8 months ago

The answer is B

Because:

Option A: Does not validate the kwh arguments, and could be receive negative "watts".

Option C: The addKwh method was declared private, it is not accessible in the Customer class.

Option D: The bill member variable is not being changed, only the local scope of the setBill method is being used.

upvoted 2 times

  **iSnover** 2 years, 8 months ago

The answer is B and no need to go far, all other options are syntax error. Only the letter B remains.

A toString convert a StringBuffer to a string

upvoted 1 times

Given:

```
interface Readable {
    public void readBook();
    public void setBookMark();
}

abstract class Book implements Readable {    // line n1
    public void readBook() { }
    // line n2
}

class Ebook extends Book {                    // line n3
    public void readBook() { }
    // line n4
}
```

And given the code fragment:

```
Book book1 = new Ebook();
```

```
book1.readBook();
```

Which option enables the code to compile?

- ☐ A) Replace the code fragment at line n1 with:  
class Book implements Readable {
- ☐ B) At line n2 insert:  
public abstract void setBookMark();
- ☐ C) Replace the code fragment at line n3 with:  
abstract class Ebook extends Book {
- ☐ D) At line n4 insert:  
public void setBookMark() { }

A. Option A

B. Option B

C. Option C

D. Option D

**Suggested Answer: D**

Community vote distribution

D (100%)

☐ **vic88** 7 months ago

**Selected Answer: D**

@Override

```
public void setBookMark() {
```

```
}
```

upvoted 1 times

☐ **gg7495** 1 year, 9 months ago

C and D could be both correct. However, in the code fragment we are creating object of class Ebook thus, it cannot be abstract.

Thus, the correct answer is (D)

upvoted 1 times

☐ **Vicky\_65** 2 years, 3 months ago

**Selected Answer: D**

D is the correct answer.because we need to give all abstract methods in interface in class which is implementing the interface

upvoted 1 times

☐ **Ankit1010** 2 years, 4 months ago

D is the correct answer.

upvoted 1 times

🗨️ 👤 **willokans** 2 years, 7 months ago

D - As concrete class will need to implement unimplemented interface method.

Java Abstract class can implement interfaces without even providing the implementation of interface methods

upvoted 2 times

🗨️ 👤 **Def8** 2 years, 8 months ago

**Selected Answer: D**

A concrete class needs to implement all the abstract methods.

upvoted 2 times

🗨️ 👤 **iSnover** 2 years, 8 months ago

**Selected Answer: D**

The answer is letter D, answers A and B are clearly wrong, C would also be right, but what shows that it is wrong is the code fragment that calls the class directly. You cannot instantiate abstract classes directly as it was done in the code snippet, so the letter D is correct, implement the abstracted method.

upvoted 2 times

🗨️ 👤 **HamiltonValerio** 2 years, 8 months ago

Answer is C. super(); MUST be first all the time. In the example we have B and C but B is not correct cause I not using the this.r variable so only C is correct

upvoted 1 times

🗨️ 👤 **SSJ5** 3 years, 1 month ago

C should be the answer

upvoted 1 times

🗨️ 👤 **levilevi** 3 years, 11 months ago

A is not correct because there is no default constructor in CD.

upvoted 4 times

🗨️ 👤 **SamAru** 4 years ago

Agree with Answer C!

upvoted 3 times

🗨️ 👤 **v323rs** 4 years, 5 months ago

I'm agree with azmikadir, the correct answer C

upvoted 5 times

Given the code fragment:

```
int a[] = {1, 2, 3, 4, 5};
for (XXX) {
    System.out.print(a[e]);
}
```

Which option can replace xxx to enable the code to print 135?

A.

```
int e = 0; e <= 4; e++
```

B.

```
int e = 0; e < 5; e += 2
```

C.

```
int e = 1; e <= 5; e += 1
```

D.

```
int e = 1; e < 5; e += 2
```

**Suggested Answer: B**

 **KarreRavi** 3 months, 2 weeks ago

Option is B

upvoted 1 times

 **TheeOne** 5 months, 1 week ago

Option B

-- First time e = 0, which is el on index 0. = 1

-- Second time e = 2, which is el on index 2 = 3

-- Third time e = 4, which is el on index 4 = 5

```
public static void main(String[] args) {
```

```
int a[] = {1, 2, 3, 4, 5};
```

```
for(int e=0;e<5;e+=2){
```

```
System.out.println(a[e]);
```

```
}
```

```
}
```

upvoted 1 times

 **TheeOne** 5 months, 1 week ago

B is correct. e is the index, we print el on index0, then index2, then index 4

upvoted 1 times

 **iammtander** 11 months, 3 weeks ago

A STEP BY STEP ANSWER EXPLAINED

- The correct answer is B: int e = 0; e < 5; e += 2 : WHY?

- This option initializes e to 0, continues the loop while e is less than 5, and increments e by 2 each iteration.

- This results in accessing array elements at indices 0, 2, and 4, which correspond to the values 1, 3, and 5.

- Therefore, option B will enable the code to print 135.

Which statement best describes encapsulation?

- A. Encapsulation ensures that classes can be designed so that only certain fields and methods of an object are accessible from other objects.
- B. Encapsulation ensures that classes can be designed so that their methods are inheritable.
- C. Encapsulation ensures that classes can be designed with some fields and methods declared as abstract.
- D. Encapsulation ensures that classes can be designed so that if a method has an argument MyType x, any subclass of MyType can be passed to that method.

Given the code fragment from three files:

SalesMan.java:

```
package sales;
public class SalesMan { }
```

Product.java:

```
package sales.products;
public class Product { }
```

Market.java:

```
1. package market;
2. // insert code here
3. public class USMarket {
4.     SalesMan sm;
5.     Product p;
6. }
```

Which code fragment, when inserted at line 2, enables the code to compile?

- ☐ A) `import sales.*;`
- ☐ B) `import java.sales.products.*;`
- ☐ C) `import sales;`  
`import sales.products;`
- ☐ D) `import sales.*;`  
`import products.*;`
- ☐ E) `import sales.*;`  
`import sales.products.*;`

A. Option A

B. Option B

C. Option C

D. Option D

E. Option E

🗨️ 👤 **SamAru** 5 years ago

Agreed, Option E is correct!

upvoted 4 times

Given this class:

```
public class CheckingAccount {
    public int amount;
    public CheckingAccount(int amount){
        this.amount = amount;
    }
    public int getAmount(){ return amount; }
    public void setAmount(int amount){ this.amount = amount; }
    public void changeAmount(int x){
        amount += x;
    }
}
```

And given this main method, located in another class:

```
public static void main(String[] args) {
    CheckingAccount acct = new CheckingAccount((int)(Math.random()*1000));
    //line n1
    System.out.println(acct.getAmount());
}
```

Which three lines, when inserted independently at line n1, cause the program to print a 0 balance? (Choose three.)

- A. acct.setAmount(-acct.getAmount());
- B. acct.amount = 0;
- C. acct.setAmount(0);
- D. acct.getAmount() = 0;
- E. this.amount = 0;
- F. acct.changeAmount(0);
- G. acct.changeAmount(-acct.amount);

**Suggested Answer:** BDF

Community vote distribution

BCG (100%)

**baledevit** Highly Voted 2 years, 9 months ago

**Selected Answer:** BCG

The correct answer is BCG

B - The variable "amount" in Class CheckingAccount is public, which allows the change from the instance to the main method

C - method setAmount () when called from the instance in the main method allows to modify the variable "amount" in the instance of CheckingAccount

G - The changeAmount () method receives in input the same value present in the CheckingAccount instance but in negative. Being public, the variable does not generate an error.

Tested, answer is only C.

A and B, didnt print anything.

D throws Exception (ArrayIndexOutOfBoundsException).

upvoted 2 times

  **carloswork** 2 years, 8 months ago

Rewriting, A didn't print anything. B prints only "small:"

upvoted 2 times

  **hhuo** 2 years, 8 months ago

Could anyone explain why B is not correct? I tested it, and it showed the exactly same result as C (red:blue:small:medium:).

upvoted 1 times

  **carloswork** 2 years, 8 months ago

For me, B option returned only "small:"

upvoted 2 times

  **anmoldev2java** 2 years, 7 months ago

for the first comparison where index = 0 and idx = 0 the condition idx < index will fail iteself.

upvoted 1 times

  **wk8b** 2 years, 9 months ago

only C

D is incorrect:

red:blue:Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: 2  
upvoted 1 times

Given the code fragment:

```
public class Test{

    void readCard(int cardNo) throws Exception {
        System.out.println("Reading Card");
    }

    void checkCard(int cardNo) throws RuntimeException { // line n1
        System.out.println("Checking Card");
    }

    public static void main(String[] args) {
        Test ex = new Test();
        int cardNo = 12344;
        ex.readCard(cardNo);           //line n2
        ex.checkCard(cardNo);         //line n3
    }
}
```

What is the result?

- A.  
Reading Card  
Checking Card
- B. Compilation fails only at line n1.
- C. Compilation fails only at line n2.
- D. Compilation fails only at line n3.
- E. Compilation fails at both line n2 and line n3.

**Suggested Answer:** D

 **RoxyFoxy** Highly Voted 2 years, 9 months ago

I think the correct answer is C. The exception for readCard() must be caught or declared to be thrown.  
upvoted 14 times

        ex.checkCard(cardNo);  
    }  
}
```

upvoted 2 times

🗨️ 👤 **duydn** 1 year, 10 months ago

C is the correct one, because when method throw checked exception, u have to handle it.

upvoted 1 times

🗨️ 👤 **a\_really\_reliable\_programmer** 1 year, 10 months ago

Answer is C

A, compile error (Does not print)

B, The method itself is not wrong, you just have to try/catch

C, Did not catch the Exception

D, Last line won't fail because it's method is runtime and runtime doesn't happen if it doesn't even compile.

upvoted 2 times

🗨️ 👤 **Sreeni\_A** 1 year, 10 months ago

C is correct

upvoted 1 times

🗨️ 👤 **jlicini** 1 year, 11 months ago

C, Unhandled exception: java.lang.Exception ... Runtime is unchecked exception

upvoted 1 times

🗨️ 👤 **dsms** 1 year, 11 months ago

C is the correct

upvoted 1 times

🗨️ 👤 **billy\_the\_kid** 2 years, 1 month ago

Answer is C. Checked Exceptions should be handled or declared, in this case the problem is that we missed to declare the Exception in main method.

So in order your code to pass the compilation, you should add at the main method "throws Exception".

upvoted 1 times

🗨️ 👤 **Vicky\_65** 2 years, 3 months ago

The answer is option C. Because checked exception should be declared or handle in main method for readcard method.

upvoted 2 times

Given the code fragment:

```
3. public static void main(String[] args) {  
4.     int x = 5;  
5.     while (isAvailable(x)) {  
6.         System.out.print(x);  
7.  
8.     }  
9. }  
10.  
11. public static boolean isAvailable(int x) {  
12.     return x-- > 0 ? true : false;  
13. }
```

Which modification enables the code to print 54321?

- A. Replace line 6 with `System.out. print (--x) ;`
- B. At line 7, insert `x --;`
- C. Replace line 6 with `--x;` and, at line 7, insert `System.out.print (x);`
- D. Replace line 12 with `return (x > 0) ? false: true;`

Answer is B

upvoted 27 times

  **Mamlouk\_Med** Highly Voted 6 years, 4 months ago

answer is B,

Sur la ligne 12 du programme, l'utilisation de "x--" dans la méthode isAvailable n'affecte pas la variable x de la méthode principale, car Java est toujours "pass by value".

L'option A fera la sortie "43210".

Option B, vous pouvez générer avec succès "54321".

Option C, cette logique est la même que l'option A.

L'option D, tant que la boucle ne sera pas exécutée.

upvoted 11 times

  **vic88** Most Recent 7 months ago

**Selected Answer: B**

x-- at line 7

upvoted 1 times

  **7df49fb** 1 year, 3 months ago

B

changes made to x inside the isAvailable method do not affect the x in the main method because Java passes arguments by value.

Answer is B.

To test:

```
public class Test {  
    public static void main(String[] args) {  
        int x = 5;  
        while(isAvailable(x)) {  
            System.out.print(x);  
            x--; // Answer B - Its ok.  
        }  
    }  
}
```

```
public static boolean isAvailable (int x) {  
    return x-- > 0 ? true : false;  
}  
}
```

Given the code fragment:

```

4. public static void main(String[] args) {
5.     boolean opt = true;
6.     switch (opt) {
7.         case true:
8.             System.out.print("True");
9.             break;
10.        default:
11.            System.out.print("***");
12.        }
13.    System.out.println("Done");
14. }

```

Which modification enables the code fragment to print TrueDone?

- A. Replace line 5 With String opt = "true"; Replace line 7 with case "true":
- B. Replace line 5 with boolean opt = !; Replace line 7 with case 1:
- C. At line 9, remove the break statement.
- D. Remove the default section.

Antwort B ergibt kein sinn , also es muss ein String sein , und bei C und D auslassen oder nicht kommt nur ; DONE raus  
public static void main(String[] args) {  
String opt = " true";

switch (opt) {  
case "true":

System.out.print("True");

```
// break;  
// default:  
System.out.print("***");  
  
}  
System.out.println("Done");  
  
}  
  
}
```

also nur Done / oder ?

upvoted 1 times

Given the following main method:

```
public static void main(String[] args) {
    int num = 5;
    do {
        System.out.print(num-- + " ");
    } while (num == 0);
}
```

What is the result?

- A. 5 4 3 2 1 0
- B. 5 4 3 2 1
- C. 4 2 1
- D. 5
- E. Nothing is printed

duydn 1 year, 10 months ago

**Selected Answer: B**

Short and Integer cannot cast to String -> B

upvoted 1 times

NabilBenAsker 1 year, 12 months ago

**Selected Answer: B**

Short and Integer cannot convert to String. to fix this issue you must to change to String s3=String.valueOf(s1+s2)

upvoted 1 times

NabilBenAsker 1 year, 12 months ago

Tested answer B Short cannot be converted to String

upvoted 2 times

Kolodets 2 years, 2 months ago

ClassCastException impossible, because inconvertible types => Compilation fails at N1

upvoted 1 times

Ankit1010 2 years, 4 months ago

B is the correct answer as cannot cast int to java.lang.String.

upvoted 4 times

carloswork 2 years, 8 months ago

**Selected Answer: B**

Tested, answer is B.

Source code to test:

```
public static void main(String[] args) {  
    Short s1 = 200;  
    Integer s2 = 400;  
    String s3 = (String) (s1 + s2); // line n1  
    Long s4 = (long) s1 + s2; // line n2  
    System.out.println("Sum is " + s3);  
}
```

A correct convert to string could be:

```
String s3 = String.valueOf(s1 + s2);  
upvoted 4 times
```

🗲️ 👤 **UAK94** 2 years, 8 months ago

Correct is B. Because the ClassCastException is a RuntimeException and it may not affect compilation. But here compilation fails at n1.

upvoted 2 times

🗲️ 👤 **iSnover** 2 years, 8 months ago

**Selected Answer: B**

Correct is B. Because the ClassCastException occurs when we try to cast to a PRIMITIVE variable type that does not hold the variable's value. String is not a primitive type and a primitive type cannot cast to a non-primitive type, error occurs when executing code on line n1.

upvoted 3 times

🗲️ 👤 **Rdharma** 2 years, 9 months ago

B is the answer. int cannot be converted to String

**Selected Answer: B**

incompatible types: int cannot be converted to java.lang.String!

upvoted 4 times

Given the code fragment:

```
public class Employee {
    String name;
    boolean contract;
    double salary;
    Employee() {
        // line n1
    }
    public String toString(){
        return name + ":" + contract + ":" + salary;
    }
    public static void main(String[] args) {
        Employee e = new Employee();
        // line n2
        System.out.print(e);
    }
}
```

Which two modifications, when made independently, enable the code to print joe:true: 100.0? (Choose two.)

- ☐ A) Replace line n2 with:  
`e.name = "Joe";`  
`e.contract = true;`  
`e.salary = 100;`
- ☐ B) Replace line n2 with:  
`this.name = "Joe";`  
`this.contract = true;`  
`this.salary = 100;`
- ☐ C) Replace line n1 with:  
`this.name = new String("Joe");`  
`this.contract = new Boolean(true);`  
`this.salary = new Double(100);`
- ☐ D) Replace line n1 with:  
`name = "Joe";`  
`contract = TRUE;`  
`salary = 100.0f;`
- ☐ E) Replace line n1 with:  
`this("Joe", true, 100);`

A. Option A

B. Option B

C. Option C

D. Option D

E. Option E

a and c are correct

upvoted 1 times

🗨️ 👤 **carloswork** 2 years, 8 months ago

**Selected Answer: AC**

Tested. Answer is A and C.

Comments:

\* Option C works even though it has been deprecated since version 9 (1z0-808 is about java 8).

\*\* Option B would only be correct if it is inside the constructor, on line n1. As option B is pointing to line n2, it will throws an error.

upvoted 2 times

🗨️ 👤 **carloswork** 2 years, 8 months ago

Here is the code for testing:

```
public class Employee {
```

```
    String name;
```

```
    Boolean contract;
```

```
    double salary;
```

```

Employee(){
// Line n1 - Option C
/* this.name = new String("Joe");
this.contract = new Boolean(true);
this.salary = new Double(100); */
}

public String toString() {
return name + " : " + contract + " : " + salary;
}

public static void main(String [] args) {
Employee e = new Employee();

// Line n2 - Option A
/* e.name = "Joe";
e.contract = true;
e.salary = 100; */

// Line n2 - Option B
/* this.name = "Joe";
this.contract = true;
this.salary = 100; */

System.out.print(e);
}
}

```

upvoted 3 times

  **iSnover** 2 years, 8 months ago

**Selected Answer: AC**

The correct options are A and C, as all others contain syntax errors. It cannot be the letter B because "this" cannot be instantiated in static methods.

upvoted 1 times

  **alex\_au** 2 years, 9 months ago

Should be A, C. We cannot do B as we cannot use "this" in the static method

upvoted 2 times

  **RoxyFoxy** 2 years, 9 months ago

**Selected Answer: AB**

If C, unnecessary boxing to Boolean and Double. If we use "new" we will create new objects.

upvoted 1 times

  **iSnover** 2 years, 8 months ago

Wrong, you can't put "this" in static methods. The correct one is A and C.

upvoted 3 times

  **Kolodets** 2 years, 2 months ago

wrong, it is A, C and D

upvoted 2 times

Given the code fragment:

```
public static void main(String[] args) {
    List<String> names = new ArrayList<>();
    names.add("Robb");
    names.add("Bran");

Answer is C

compiler add super() as first statement in constructor . hence super class constructor gets called and super class initialized before child class

upvoted 1 times

**duydn** 1 year, 10 months ago

Selected Answer: C

super() added by JVM -> C is the correct one.

upvoted 1 times

**Dolly2901** 1 year, 11 months ago

by default compiler puts super() at first line inside any constructor. It calls it's super class constructor first. So correct Answer is ABC

correct,

implecit super() method execution before each system.out.println of each constructor

upvoted 1 times

Given:

```
class X {
    static int i;
    int j;
    public static void main(String[] args) {
        X x1 = new X();
        X x2 = new X();
        x1.i = 3;
        x1.j = 4;
        x2.i = 5;
        x2.j = 6;
        System.out.println(
            x1.i + " " +
            x1.j + " " +
            x2.i + " " +
            x2.j);
    }
}
```

What is the result?

A. 3 4 5 6

B. 3 4 3 6

C. 5 4 5 6

D. 3 6 4 6

array needs 2 slots => A not correct

upvoted 1 times

**Vicky\_65** 1 year, 3 months ago

B is the valid array declaration and initialization.

upvoted 2 times

**Ankit1010** 1 year, 4 months ago

B is correct.

C is wrong because of msissing [] in the left side

upvoted 2 times

🗨️ 👤 **kkaayyyy** 1 year, 8 months ago

B is the correct answer. The only difference is we first declare the array and then initialize it.

upvoted 1 times

🗨️ 👤 **iSnover** 1 year, 8 months ago

Letter B is correct and does not need to analyze too much. The letters A and D will give `ArrayIndexOutOfBoundsException` as they are creating an array with 1 space. The letter C is wrong because the "int array" needs to put the "int [] array" because the array type is instantiated like this.

upvoted 2 times

Given the code fragment:

```
public static void main(String[] args) {
    String[] arr = {"A", "B", "C", "D"};
    for (int i = 0; i < arr.length; i++) {
        System.out.print(arr[i] + " ");
        if (arr[i].equals("C")) {
            continue;
        }
        System.out.println("Work done");
        break;
    }

Which three are advantages of the Java exception mechanism? (Choose three.)

- A. Improves the program structure because the error handling code is separated from the normal program function
- B. Provides a set of standard exceptions that covers all possible errors
- C. Improves the program structure because the programmer can choose where to handle exceptions
- D. Improves the program structure because exceptions must be handled in the method in which they occurred
- E. Allows the creation of new exceptions that are customized to the particular program being created

**Suggested Answer:** ACE

Why s is 125 than ns is 0?

upvoted 1 times

🗄️ 👤 **RoxyFoxy** 2 years, 9 months ago

Hi, Emi! So, first we have:

instance variable ns = 0 and static variable s = 0

When we call the constructor, we will have:

Alpha (100): if (s < ns) then s = ns and this.ns = ns

so: if (0 < 100) then s = 100 and this.ns = 100

Alpha(50): now s = 100 because is static (updated above)

if (100 < 50) which is false. ns = 0 because the instance variable is 0.

Alpha(125): At this point, s = 100

if (100 < 125) then s = 125 and ns = 125. So here s is updated!

At this point, when we call System.out.println(), for all ref1, ref2, ref3 the value of s is 125 (remember s is static). For ref1, ns = 100, for ref2 ns = 0, and for ref3 ns = 125. I hope this helps you :) Roxy

0 2 4

upvoted 5 times

Given the code fragment:

```
LocalDate date1 = LocalDate.now();
LocalDate date2 = LocalDate.of(6, 20, 2014);
LocalDate date3 = LocalDate.parse("2014-06-20", DateTimeFormatter.ISO_DATE);
System.out.println("date1 = " + date1);
System.out.println("date2 = " + date2);
System.out.println("date3 = " + date3);
```

Assume that the system date is June 20, 2014. What is the result?

A.

```
date1 = 2014-06-20
date2 = 2014-06-20
date3 = 2014-06-20
```

B.

```
date1 = 06/20/2014
date2 = 2014-06-20
date3 = Jun 20, 2014
```

C. Compilation fails.

D. An exception is thrown at runtime.

**Suggested Answer: A**

 **baledevit**  2 years, 9 months ago

The correct answer is D. Line 2 generate an DateTimeException at runtime because method have an invalid value for the second parameter MonthOfYear (20)!

<https://docs.oracle.com/javase/8/docs/api/java/time/LocalDate.html#of-int-int-int->

upvoted 6 times

 **Philip0908**  2 years, 9 months ago

Answer is D because when using LocalDate.of, it should be arrange as year, month and day of month(e.g LocalDate.of(2014,6,20)

upvoted 5 times

 **JaMICHE**  4 months, 1 week ago

Answer is D due of LocalDate date2=LocalDate.of(6,20,2014);

upvoted 1 times

 **MPignaProTech** 8 months, 1 week ago

D is the correct answer

upvoted 1 times

 **tawa\_z58** 1 year, 6 months ago

We have a runtime exception, Because the format in which we gave the date in is not correct, it expects to see soemthing like this "2014-06-24", so if we fail to give the argument in that format, an expeption is thrown at runtime. Also, we have a compilation error on the declaration of date3, but since date2's declaration statement is the one which is first executed it means we wont get to the line where the compilation error is. The compilation error is there because we trien to use the DateTimeFormatter yet or date3's type was LocalDate not LocalDateTime.

upvoted 2 times

 **AhmadTechie** 1 year, 7 months ago

D is correct => month should be between 1-12 and day range is 1-28/31.

though there is no restriction on year range

upvoted 2 times

If date2 was initialised correctly then answer would be A

upvoted 1 times

Given the code fragment:

```
7.  StringBuilder sb1 = new StringBuilder("Duke");
8.  String str1 = sb1.toString();
9.  // insert code here
10. System.out.print(str1 == str2);
```

Which code fragment, when inserted at line 9, enables the code to print true?

- A. String str2 = str1;
- B. String str2 = new String(str1);
- C. String str2 = sb1.toString();
- D. String str2 = "Duke";

Selected Answer: A

The answer is letter A, even the string containing the content inside them as they are not considered equal, to "circumvent" this, we must instantiate the second String taking the first as a reference as "str2 = str1;" and with that we can print true with the boolean "str2 == str1".

Correct

upvoted 2 times

Given the code fragment:

```
public static void main(String[] args) {
    double discount = 0;
    int qty = Integer.parseInt(args[0]);
    //line n1;
}
```

And given the requirements:

⇒ If the value of the qty variable is greater than or equal to 90, discount = 0.5

⇒ If the value of the qty variable is between 80 and 90, discount = 0.2

Which two code fragments can be independently placed at line n1 to meet the requirements? (Choose two.)

- ☐ A) `if (qty >= 90) { discount = 0.5; }`  
`if (qty > 80 && qty < 90) { discount = 0.2; }`
- ☐ B) `discount = (qty >= 90) ? 0.5 : 0;`  
`discount = (qty > 80) ? 0.2 : 0;`
- ☐ C) `discount = (qty >= 90) ? 0.5 : (qty > 80) ? 0.2 : 0;`
- ☐ D) `if (qty > 80 && qty < 90) {`  
`discount = 0.2;`  
`} else {`  
`discount = 0;`  
`}`  
`if (qty >= 90) {`  
`discount = 0.5;`  
`} else {`  
`discount = 0;`  
`}`
- ☐ E) `discount = (qty > 80) ? 0.2 : (qty >= 90) ? 0.5 : 0;`

A. Option A

B. Option B

C. Option C

D. Option D

E. Option E

**Suggested Answer: AC**

Community vote distribution

AC (100%)

 **vic88** 7 months ago

**Selected Answer: AC**

D is not right because it's double checked again after `if (qty >= 90) {discount = 0.5}`, reset the discount to 0.

upvoted 1 times

 **BelloMio** 1 year ago

Ok I got why D is wrong.

it is wrong in the case if qty is 85 for example.

it will go in the first if condition which will make discount = 0.2 all good.

Then it will also go in the second if condition where it will go into the else statement and assign discount = 0, making the code not correct

upvoted 2 times

 **DarGrin** 1 year, 8 months ago

**Selected Answer: AC**

Only A and C are correct

upvoted 1 times

 **anassasl** 1 year, 9 months ago

why D is not correct ?

upvoted 1 times

🗨️ 👤 **montoyamontes** 1 year, 8 months ago

If qty = 80 then the result must be discount=0.2

```
if(qty> 80 && qty <90 ) { //80>90: true && 80<90: true
```

```
discount = 0.2 // this is correct
```

```
}else{
```

```
discount =0 //this is ignored
```

```
}
```

```
if(qty>=90){ //80>=90:false
```

```
discount = 0.5 //this is ignored so go to else
```

```
}else{ //
```

```
discount=0
```

```
}
```

Finally discount=0 != 0.2

upvoted 1 times

🗨️ 👤 **Vicky\_65** 2 years, 3 months ago

**Selected Answer: AC**

this is correct

upvoted 1 times

🗨️ 👤 **carloswork** 2 years, 8 months ago

**Selected Answer: AC**

Answer is AC.

It boring to test...

It is necessary to change the value of the variable 'qty' to perform the test. The code can be compiled on the command line and the value passed by "args" or simply change the value of this variable directly in the code.

That's it.

To test:

```
public static void main(String[] args) {
```

```
double discount = 0;
```

```
int qty = Integer.parseInt(args[0]);
```

```
qty=90; // change here
```

```
// Answer A
```

```
if (qty >= 90) { discount = 0.5; }
```

```
System.out.println(discount);
```

```
if (qty > 80 && qty < 90) { discount = 0.2; }
```

```
System.out.println(discount);
```

```
// Answer C
```

```
discount = (qty >= 90) ? 0.5 : (qty > 80)? 0.2: 0;
```

```
System.out.println(discount);
```

```
}
```

upvoted 1 times

🗨️ 👤 **kkaayyyy** 2 years, 8 months ago

A and C are the correct options because

in Option B we are using the discount variable twice, and thus only the second discount's value will be the final updated value

in Option D only the case where qty >= 90 will work

in Option E everytime the output printed will be 0.2 no matter if the condition is 1st or 2nd.

upvoted 3 times

Given:

```
public class Test {  
  
    public static void main(String[] args) {  
        if (args[0].equals("Hello") ? true : false) {  
            System.out.println("Success");  
        } else {  
            System.out.println("Failure");  
        }  
    }  
}
```

And given the commands:

```
javac Test.java  
Java Test Hello
```

What is the result?

- A. Success
- B. Failure
- C. Compilation fails.
- D. An exception is thrown at runtime

 **spongecodes** 2 years, 4 months ago

Selected Answer: ACE

ACE is correct as parent class methods need not be overridden in the child class, if parent class is not abstract or an interface

upvoted 2 times

 **RAADEL3IMLAK** 2 years, 5 months ago

correct answer :

A

B: a subclass must override the methods from a superclass.

This is an object-oriented feature because it allows developers to create a hierarchy of classes, where a subclass can inherit properties and behaviors from a superclass, and then override or extend those behaviors as needed. This is known as inheritance and polymorphism, which are fundamental object-oriented concepts.

C

not good :

D

E. Object is the root class of all other objects.

This is not an object-oriented feature, as Object is a class in the Java programming language that is the superclass of all other classes. It provides a common set of methods that can be called on any object, such as equals(), hashCode(), and toString().

4

5

upvoted 4 times

You are developing a banking module. You have developed a class named ccMask that has a maskcc method.

Given the code fragment:

```
class CCMask {
    public static String maskCC(String creditCard) {
        String x = "XXXX-XXXX-XXXX-";
        //line n1
    }

    public static void main(String[] args) {
        System.out.println(maskCC("1234-5678-9101-1121"));
    }
}
```

You must ensure that the maskcc method returns a string that hides all digits of the credit card number except the four last digits (and the hyphens that separate each group of four digits).

Which two code fragments should you use at line n1, independently, to achieve this requirement? (Choose two.)

- ☐ A) `StringBuilder sb = new StringBuilder(creditCard);`  
`sb.substring(15, 19);`  
`return x + sb;`
- ☐ B) `return x + creditCard.substring(15, 19);`
- ☐ C) `StringBuilder sb = new StringBuilder(x);`  
`sb.append(creditCard, 15, 19);`  
`return sb.toString();`
- ☐ D) `StringBuilder sb = new StringBuilder(creditCard);`  
`StringBuilder s = sb.insert(0, x);`  
`return s.toString();`

A. Option A

B. Option B

C. Option C

D. Option D

**Suggested Answer: BC**

Community vote distribution

BC (100%)

 **iSnover** Highly Voted 2 years, 9 months ago

Correct is B and C, because:

- A is Wrong, will print "XXXX-XXXX-XXXX-1234-5678-9101-1121" because String is immutable and in the line 2 of the Answer is an code isolated, not chance the "sb" variable
  - B is Correct, you can access the value of the method substring with the parrametr directly
  - C is Correct, with the method "append" of StringBuilder in the line 2 of the Answer, you can concatenate with an String and can choose the range of String that you want concatenate
  - D is Wrong, because de range is incorrect

B and C is the correct answer

upvoted 1 times

Given:

Acc.java:

```
package p1;
public class Acc {
    int p;
    private int q;
    protected int r;
    public int s;
}
```

Test.java:

```
package p2;
import p1.Acc;
public class Test extends Acc {
    public static void main(String[] args) {
        Acc obj = new Test();
    }
}
```

Which statement is true?

- A. Both p and s are accessible via obj.
- B. Only s is accessible via obj.
- C. Both r and s are accessible via obj.
- D. p, r, and s are accessible via obj.

**Suggested Answer: B**

Community vote distribution

B (67%)

C (33%)

 **iSnover** Highly Voted 2 years, 9 months ago

**Selected Answer: C**

The correct Answer is C, because class (even if it is outside the package) extends from the class with the protected attribute, it will have access to it. So access is by package and by inheritance.

upvoted 8 times

 **TheeOne** 5 months, 1 week ago

Incorrect:

Field r (protected) is accessible in the subclass (Test) via inheritance. However, it is not accessible via the object reference obj because obj is of type Acc, not Test. In Java, protected members are only accessible directly through inheritance or within the same package.

upvoted 1 times

 **Ru\_H33** Highly Voted 2 years, 4 months ago

Correct ans is B:

Even though Test is child of ACC we are not able to access protected r variable. Reason is packages are different. If you want to access protected member in different package then it can be accessed only using "Child class object" not using parent class or Child class reference hold by parent.

For protected r to be visible need to create object of Test t=new Test ; int pr=t.r;

Here ACC obj=new Test //We are calling protected using parent class reference hence invalid. If protected r is in same package then it would be valid

upvoted 7 times

 **jp\_ofi** Most Recent 5 months, 1 week ago

**Selected Answer: B**

It would be C if Test obj = new Test();

**Selected Answer: B**

B is correct.

upvoted 4 times

🗨️ 👤 **anmoldev2java** 2 years, 7 months ago

i also had doubt like why not c but protected are available in subclass but not on objects ... on obj private is the one we can access  
upvoted 1 times

🗨️ 👤 **jimcoun** 2 years, 8 months ago

**Selected Answer: B**

B is the correct answer.

Because the type is created as Acc, the protected field cannot be accessed.

upvoted 3 times

🗨️ 👤 **iSnover** 2 years, 8 months ago

**Selected Answer: C**

The answer is the letter C, the variable "r" is protected and it can be accessed directly by another class if the child class extends the mother even though they are in different packages.

upvoted 2 times

🗨️ 👤 **carloswork** 2 years, 8 months ago

**Selected Answer: B**

On test, answer is B.

The best way to know this, write the code and compile.

upvoted 2 times

🗨️ 👤 **carloswork** 2 years, 7 months ago

To test:

-----

// Acc.java

package p1;

```
public class Acc {  
    int p = 0;  
    private int q = 1;  
    protected int r = 2;  
    public int s = 3;  
}
```

-----

// Test.java

package p2;

import p1.Acc;

public class Test extends Acc {

public static void main(String[] args) {

Acc obj = new Test();

System.out.println(obj.p);

System.out.println(obj.q);

System.out.println(obj.r);

System.out.println(obj.s);

}

}

upvoted 1 times

Given:

Base.java:

```
class Base {
    public void test(){
        System.out.println("Base ");
    }
}
```

DerivedA.java:

```
class DerivedA extends Base {
    public void test(){
        System.out.println("DerivedA ");
    }
}
```

DerivedB.java:

```
class DerivedB extends DerivedA {
    public void test(){
        System.out.println("DerivedB ");
    }
    public static void main(String[] args) {
        Base b1 = new DerivedB();
        Base b2 = new DerivedA();
        Base b3 = new DerivedB();
        b1 = (Base) b3;
        Base b4 = (DerivedA) b3;
        b1.test();
        b4.test();
    }
}
```

What is the result?

- A. Base DerivedA
- B. Base DerivedB
- C. DerivedB DerivedB
- D. DerivedB DerivedA
- E. A ClassCastException is thrown at runtime.

Casting doesn't change the object itself. In inheritance, we create new classes that inherit features of the superclass while polymorphism decides what form of method to execute.

🗨️ 👤 **CosminCof** 3 years, 9 months ago

The correct answer is E, class cast exception

upvoted 1 times

🗨️ 👤 **letmein2** 6 years ago

Correct. There is no problem with the casting (implicit upcasting is actually optional).

upvoted 6 times

Given the code fragment:

```
public static void main(String[] args) {
    ArrayList myList = new ArrayList();
    String[] myArray;
    try {
        while (true) {
            myList.add("My String");
        }
    }
    catch (RuntimeException re) {
        System.out.println("Caught a RuntimeException");
    }
    catch (Exception e) {
        System.out.println("Caught an Exception");
    }
    System.out.println("Ready to use");
}
```

What is the result?

- A. Execution terminates in the first catch statement, and Caught a RuntimeException is printed to the console.
- B. Execution terminates in the second catch statement, and Caught an Exception is printed to the console.
- C. A runtime error is thrown in the thread "main".
- D. Execution completes normally, and Ready to use is printed to the console.
- E. The code fails to compile because a throws keyword is required.

  **365everyday** 4 years, 9 months ago

The while loop executes continuously, and keeps shoving strings into the array. Eventually the program will fail, because it will run out of memory (hence the error). Nothing gets printed, as there are no exceptions thrown and the println statement is never reached.

upvoted 7 times

Given:

```

Correct

upvoted 2 times

Given the code fragments:

Person.java:

```
public class Person {
    String name;
    int age;

    public Person(String n, int a) {
        name = n;
        age = a;
    }

    public String getName() {
        return name;
    }

    public int getAge() {
        return age;
    }
}
```

Test.java:

```
public static void checkAge(List<Person> list, Predicate<Person> predicate) {
    for (Person p : list) {
        if (predicate.test(p)) {
            System.out.println(p.name + " ");
        }
    }
}

public static void main(String[] args) {
    List<Person> iList = Arrays.asList(new Person("Hank", 45),
                                        new Person("Charlie", 40),
                                        new Person("Smith", 38));

    //line n1
}
```

Which code fragment, when inserted at line n1, enables the code to print Hank?

A.

```
checkAge (iList, ( ) -> p. get Age ( ) > 40);
```

B.

```
checkAge(iList, Person p -> p.getAge( ) > 40);
```

C.

```
checkAge (iList, p -> p.getAge ( ) > 40);
```

D.

```
checkAge(iList, (Person p) -> { p.getAge() > 40; });
```

upvoted 1 times

🗳️ 👤 **hcampos** 4 years, 9 months ago

C is correct. You should try the following code.

```
public static void main(String[] args) {  
    String str = "";  
    str.trim ();  
    System.out.println (str.equals ("") + "" + str.isEmpty ());  
}
```

upvoted 1 times

🗳️ 👤 **tamanna786** 4 years, 9 months ago

it is false false. there is a space between to double quotes .

upvoted 1 times

🗳️ 👤 **pillu2012** 4 years, 9 months ago

B is right

upvoted 1 times

🗳️ 👤 **hcampos** 4 years, 9 months ago

B is wrong because str.trim () returns a new string instance.

In the end, str continues with the original value.

upvoted 1 times

🗳️ 👤 **atlassi708** 4 years, 7 months ago

not a new string instance but put an empty string in the string pool

but the main cause is that String is an immutable class

upvoted 3 times

🗳️ 👤 **M\_Jawad** 5 years, 6 months ago

correct

upvoted 2 times

Given the code fragment:

```
public class App {
    public static void main(String[] args) {
        String str1 = "Java";
        String str2 = new String("java");
        //line n1
        {
            System.out.println("Equal");
        } else {
            System.out.println("Not Equal");
        }
    }
}
```

Which code fragment, when inserted at line n1, enables the App class to print Equal?

- ☐ A) `Str 1.toLowerCase();`  
    `if (str1 == str2)`
- ☐ B) `if (str2.equals(str1.toLowerCase()))`
- ☐ C) `Str 1.toLowerCase();`  
    `if (str1.equals(str1.toLowerCase()))`
- ☐ D) `if (str1.toLowerCase() == str2.toLowerCase())`

A. Option A

B. Option B

C. Option C

D. Option D

**Suggested Answer: B**

Community vote distribution

B (100%)

 **kkaayyyy** Highly Voted 1 year, 8 months ago

B is the correct option because == operator checks the same address and as str1 and str2 have different addresses but same content.  
upvoted 5 times

**Selected Answer: A**

Answer is A.

Notice that the loop iterates over the size of the array + 1, throwing an exception. It will print the 4 elements of the array and the exception (ArrayIndexOutOfBoundsException).

upvoted 1 times

  **kkaayyyy** 2 years, 8 months ago

Correct answer is A not B

upvoted 1 times

  **RoxyFoxy** 2 years, 9 months ago

**Selected Answer: A**

The correct answer is A because when i = 4, arr[4] does not exist, so ArrayIndexOutOfBoundsException!

upvoted 2 times

  **Joker74** 2 years, 9 months ago

**Selected Answer: A**

Answer: A

It prints 1 2 3 4 and then when we try to access arr[arr.length+1] causes the ArrayIndexOutOfBoundsException.

upvoted 2 times

Given the code fragment:

```
String[] strs = new String[2];
int idx = 0;
for (String s : strs) {
    strs[idx].concat(" element " + idx);
    idx++;
}
for (idx = 0; idx < strs.length; idx++) {
    System.out.println(strs[idx]);
}
```

What is the result?

- A. Element 0 Element 1
- B. Null element 0 Null element 1
- C. Null Null
- D. A NullPointerException is thrown at runtime.

**Suggested Answer: D**

Community vote distribution

D (100%)

 **Saftschnitzel**  5 years, 2 months ago

To add to the explanation: The JVM throws a null pointer exception because a method (concat()) is called on an object containing null. Note that the print() method does not cause JVM to throw an exception and prints null.

upvoted 23 times

 **letmein2**  6 years ago

correct.

null pointer is thrown at the line  
strs[idx].concat("element" + idx);  
because strs[0] is null.

upvoted 6 times

 **vic88**  6 months, 3 weeks ago

**Selected Answer: D**

D is right.

During each iteration:

First iteration (idx = 0):

strs[0] is null.

strs[idx].concat(" element " + idx) attempts to call concat on null, which leads to a NullPointerException.

upvoted 1 times

 **Vicky\_65** 2 years, 2 months ago

this() and super() cannot both be used in the same constructor call: In a single constructor, you can either call another constructor in the same class using this() or call a constructor in the superclass using super(). You cannot use both of them in a single constructor call.

upvoted 1 times

Given the definitions of the MyString class and the Test class:

MyString.java:

```
package p1;
class MyString {
    String msg;
    MyString(String msg) {
        this.msg = msg;
    }
}
```

Test.java:

```
package p1;
public class Test {
    public static void main(String[] args) {
        System.out.println("Hello " + new StringBuilder("Java SE 8"));
        System.out.println("Hello " + new MyString("Java SE 8"));
    }
}
```

What is the result?

A.

```
Hello Java SE 8
Hello Java SE 8
```

B.

```
Hello java.lang.StringBuilder@<<hashcode1>>
Hello p1.MyString@<<hashcode2>>
```

C.

```
Hello Java SE 8
Hello p1.MyString@<<hashcode>>
```

D. Compilation fails at the Test class

**Suggested Answer:** C

 **iSnover** Highly Voted 1 year, 8 months ago

The correct one is the letter C and it has been tested. The reason for presenting the hashcode is because the MyString object does not have the toString method, whereas the StringBuilder does, which is why it printed correctly.

upvoted 7 times

 **DriftKing** Most Recent 10 months ago

Answer is C.

Code -

```
class MyString {
    String msg;
    MyString(String msg) {
        this.msg=msg;
    }
}

// Since both classes are in same package
public class Test {
    public static void main(String[] args) {
        System.out.println("Hello "+ new StringBuilder("Java SE 8"));
        System.out.println("Hello "+ new MyString("Java SE 8"));
    }
}
```

We can't convert float to int && Double to float && Double to int. Basically we can't convert Bigger datatypes to smaller ones without some explicit type casting.

So Answer is 8, 9, 11 i.e. BCE

upvoted 1 times

🗨️ 👤 **iSnover** 2 years, 9 months ago

Selected Answer: BCE

Correct is BCE:

A - Float can be a int;

D - Double can be a Float;

F - Double can be a int.

upvoted 2 times

  **Joker74** 2 years, 9 months ago

**Selected Answer: BCE**

We can't convert larger data type into smaller data type without using explicit type casting.

Eg: float f=100.1f;

int i=f; //we can't do this

int x=(int) f; //explicit type casting we can do this

upvoted 3 times

Given:

MainTest.java:

```
public class MainTest {
    public static void main(int[] args) {
        System.out.println("int main " + args[0]);
    }
    public static void main(Object[] args) {
        System.out.println("Object main " + args[0]);
    }
    public static void main(String[] args) {
        System.out.println("String main " + args[0]);
    }
}
```

and commands:

```
javac MainTest.java
java MainTest 1 2 3
```

What is the result?

- A. int main 1
- B. Object main 1
- C. String main 1
- D. Compilation fails
- E. An exception is thrown at runtime

**Suggested Answer: D**

Correct Answer is A

upvoted 1 times

🗨️ 👤 **iSnover** 1 year, 2 months ago

The correct one is the letter A, remember that when instantiating a matrix, the first [] represents the rows and the second [] represents the column, that is, [1][3] means a matrix of one row and 3 columns. and following the for logic of the question, it will print the answer of the letter A.

upvoted 2 times

Given this code for a Planet object:

```
public class Planet {
    public String name;
    public int moons;

    public Planet(String name, int moons) {
        this.name = name;
        this.moons = moons;
    }
}
```

And this method:

```
public static void main(String[] args){
    Planet[] planets = {
        new Planet("Mercury", 0),
        new Planet("Venus", 0),
        new Planet("Earth", 1),
        new Planet("Mars", 2)
    };

    System.out.println(planets);
    System.out.println(planets[2].name);
    System.out.println(planets[2].moons);
}
```

What is the output?

A.

```
planets
Earth
1
```

B.

```
[LPlanets.Planet;@15db9742
Earth
1
```

C.

```
[LPlanets.Planet;@15db9742
Planets.Planet@6d06d69c
1
```

D.

```
[LPlanets.Planet;@15db9742
Planets.Planet@6d06d69c

You are asked to develop a program for a shopping application, and you are given this information:

- ⇒ The application must contain the classes Toy, EduToy, and ConsToy. The Toy class is the superclass of the other two classes.
- ⇒ The int calculatePrice (Toy t) method calculates the price of a toy.
- ⇒ The void printToy (Toy t) method prints the details of a toy.

Which definition of the Toy class adds a valid layer of abstraction to the class hierarchy?

A.

```
public abstract class Toy(  
    public abstract int calculatePrice(Toy t);  
    public void printToy(Toy t) { /* code goes here */ }  
)
```

B.

```
public abstract class Toy {  
    public int calculatePrice(Toy t) ;  
    public void printToy(Toy t) ;  
}
```

C.

```
public abstract class Toy {  
    public int calculatePrice(Toy t);  
    public final void printToy(Toy t){ /* code goes here */ }  
}
```

D.

```
public abstract class Toy {  
    public abstract int calculatePrice(Toy t) { /* code goes here */ }  
    public abstract void printToy(Toy t) { /* code goes here */ }  
}
```

Suggested Answer: A

  **iSnover** Highly Voted 1 year, 8 months ago

The wording of the question is a little complex, but looking at the answers we can eliminate the wrong ones and quickly mark the right option which is the letter A. An abstract class, unlike an interface, can exist without any abstract method, but when reading the question needs to have at least one abstract method to work correctly, eliminating options B and C. The "printToy" method doesn't need to be abstract because it can sell a toy without a description, but we can't sell a toy without a price so the only method that needs to be abstract is the "calculatePrice". Which indicates that the correct answer is the letter A.

Given the following code:

```
int[] intArr = {15, 30, 45, 60, 75};
intArr[2] = intArr[4];
intArr[4] = 90;
```

What are the values of each element in intArr after this code has executed?

- A. 15, 60, 45, 90, 75
- B. 15, 90, 45, 90, 75
- C. 15, 30, 75, 60, 90
- D. 15, 30, 90, 60, 90
- E. 15, 4, 45, 60, 90

upvoted 1 times

Given the content of three files:

A.java:

```
public class A {  
    public void a() {}  
    int a;  
}
```

B.java:

```
public class B {  
    private int doStuff() {  
        private int x = 100;  
        return x++;  
    }  
}
```

C.java:

```
import java.io.*;  
package pl;  
class A {  
    public void main(String fileName) throws IOException { }  
}
```

Which statement is true?

- A. Only the A.Java file compiles successfully.
- B. Only the B.java file compiles successfully.
- C. Only the C.java file compiles successfully.
- D. The A.Java and B.java files compile successfully.
- E. The B.java and C.java files compile successfully.
- F. The A.Java and C.java files compile successfully.

**Suggested Answer: A**

Community vote distribution

A (100%)

 **ashwinbalu**  5 years, 1 month ago

Correct answer is A. class B won't compile as we can't have private or protected variables in a block. class C won't compile as package declaration should be first statement followed by import statement (s).

upvoted 21 times

 **Stewart125**  4 years, 8 months ago

Comments here are incorrect as to why C won't compile. The format should be;

Package

Imports

Class

upvoted 6 times

 **MPignaProTech**  8 months, 2 weeks ago

**Selected Answer: A**

Only A compile. in B we have private variable in a block this cannot compile

upvoted 1 times

 **DriftKing** 1 year, 10 months ago

**Selected Answer: A**

Only A.java will compile.

Class B won't compile because the scope of the local variables belong to the method/block/constructor/ these are not accessed from outside, therefore, having access specifiers like public, private, protected (which allows access outside of the current context) makes no sense.

Class C won't compile as package should be the first statement and then import.

upvoted 2 times

🗳️ 👤 **dsms** 1 year, 10 months ago

upvoted 1 times

🗳️ 👤 **zelimir** 5 years, 3 months ago

F - C compiles successfully too

upvoted 1 times

🗳️ 👤 **krkpnr** 5 years, 3 months ago

Main method must be static

upvoted 1 times

🗳️ 👤 **Saftschnitzel** 5 years, 2 months ago

Not true. You can have a method called main, which is not static, but cannot be compiled through the command line directly. The issue here is the package statement following the import statement, when it should be the other way round.

upvoted 8 times

🗳️ 👤 **natiqbashir** 4 years, 5 months ago

Sorry, but you both wrong. Check the order of package and import statements in the C class

upvoted 1 times

🗳️ 👤 **v323rs** 5 years, 5 months ago

A - correct, Only the A.Java file compiles successfully.

upvoted 5 times

Given the code fragment:

```
int[] array = {1, 2, 3, 4, 5};
```

And given the requirements:

1. Process all the elements of the array in the order of entry.
2. Process all the elements of the array in the reverse order of entry.
3. Process alternating elements of the array in the order of entry.

Which two statements are true? (Choose two.)

- A. Requirements 1, 2, and 3 can be implemented by using the enhanced for loop.
- B. Requirements 1, 2, and 3 can be implemented by using the standard for loop.
- C. Requirements 2 and 3 CANNOT be implemented by using the standard for loop.
- D. Requirement 1 can be implemented by using the enhanced for loop.
- E. Requirement 3 CANNOT be implemented by using either the enhanced for loop or the standard for loop.

**Suggested Answer:** DE

Community vote distribution

BD (100%)

 **iSnover** Highly Voted 2 years, 8 months ago

The Correct options are BD. I'm gonna explain:

A -> Wrong, because enhanced for cannot read collections in reverse and alternately, it loops through each element and only in an ascending way.

B -> Correct, with standard for you can go through elements of a collection in ascending, descending and alternating ways.

C -> Wrong, you can loop backwards through an i- in the third parameter of your for with the correct condition and you can also access collections alternately instead of putting "i++" in the third parameter of the standard for you, you can put the expression "i = i + 2" or any other number you want in place of 2.

D -> Correct, an enhanced for processes all elements of an array in input form.

E -> Wrong, you can do it alternately with a standard for as I explained in alternative C.

E is an indecisive answer

upvoted 1 times

Which statement is true about Java byte code?

- A. It can run on any platform.
- B. It can run on any platform only if it was compiled for that platform.
- C. It can run on any platform that has the Java Runtime Environment.
- D. It can run on any platform that has a Java compiler.
- E. It can run on any platform only if that platform has both the Java Runtime Environment and a Java compiler.

**Suggested Answer: D**

Java bytecodes help make "write once, run anywhere" possible. You can compile your program into bytecodes on any platform that has a Java compiler. The bytecodes can then be run on any implementation of the Java VM. That means that as long as a computer has a Java VM, the same program written in the Java programming language can run on Windows 2000, a Solaris workstation, or on an iMac.

  **UAK94** 1 year, 8 months ago

Answer is A.

```
public class Triangle {
```

```
    static double area;
```

```
    int b=2, h=3;
```

```
    public static void main(String[] args) {
```

```
        double p,b,h;
```

```
        if (area==0) {
```

```
            b=3;
```

```
            h=4;
```

```
            p=0.5;
```

```
            area=p*b*h;
```

```
        }
```

```
        System.out.println(area);
```

```
    }
```

```
}
```

upvoted 3 times

Given the code fragment:

```
public class Test {
    public static void main(String[] args) {
        //line n1
        switch (x) {
            case 1:
                System.out.println("One");
                break;
            case 2:
                System.out.println("Two");
                break;
        }
    }
}
```

Which three code fragments can be independently inserted at line n1 to enable the code to print One? (Choose three.)

- A. byte x = 1;
- B. short x = 1;
- C. String x = "1";
- D. long x = 1;
- E. double x = 1;
- F. Integer x = new Integer("1");

A B F is correct

switch accepts => 'char, byte, short, int, Character, Byte, Short, Integer, String, or an enum'

upvoted 4 times

 **RAADEL3IMLAK** 12 months ago

D is also correct long x = 1;

upvoted 1 times

 **Ru\_H33** 10 months, 1 week ago

Switch don't accept long .

upvoted 3 times

 **carloswork** 1 year, 2 months ago

**Selected Answer: ABF**

Answer is ABF.

Simple test:

```
public static void main(String[] args) {
```

```
    Integer x = new Integer("1");
```

```
    switch(x) {
```

```
        case 1:
```

```
            System.out.println("Integer");
```

```
        break;
```

default:

```
System.out.println("Nothing");  
}
```

```
}
```

upvoted 1 times

  **UAK94** 1 year, 2 months ago

ABF is correct.

upvoted 1 times

Given:

```
public class App {  
    public static void main(String[] args) {  
        Boolean[] bool = new Boolean[2];  
  
        bool[0] = new Boolean(Boolean.parseBoolean("true"));  
        bool[1] = new Boolean(null);  
  
        System.out.println(bool[0] + " " + bool[1]);  
    }  
}
```

What is the result?

- A. True false
- B. True null
- C. Compilation fails
- D. A NullPointerException is thrown at runtime

Correct Answer - A (True, False) - tested

upvoted 1 times

🗨️ 👤 **this\_nickname** 3 years, 11 months ago  
new Boolean(null) will call the constructor :  

```
public Boolean(String s) {  
    this(parseBoolean(s));  
}  
  
public static boolean parseBoolean(String s) {  
    return ((s != null) && s.equalsIgnoreCase("true"));  
}
```

So the returned value will be false.

The answer is A

upvoted 4 times

🗨️ 👤 **auroravismara** 4 years ago  
Correct answer is B. tested -> True null in console  

```
Boolean[] x = new Boolean[2];  
x[0] = new Boolean(Boolean.parseBoolean("true"));  
x[1] = null;  
System.out.println(x[0] + " " + x[1]);
```

by default anything else is a false.

```
private static boolean toBoolean(String name) {  
    return ((name != null) && name.equalsIgnoreCase("true"));  
}
```

  
upvoted 2 times

Given the following code for the classes MyException and Test:

```
public class MyException extends RuntimeException {}

public class Test {
    public static void main(String[] args) {
        try {
            method1();
        }
        catch (MyException ne) {
            System.out.print("A");
        }
    }
    public static void method1() { // line n1
        try {
            throw Math.random() > 0.5 ? new MyException() : new RuntimeException();
        }
        catch (RuntimeException re) {
            System.out.print("B");
        }
    }
}
```

What is the result?

- A. A
- B. B
- C. Either A or B
- D. A B
- E. A compile time error occurs at line n1

The correct answer would be D, if the author is serious here to miss a closing brace at the end of the class.

upvoted 2 times

🗨️ 👤 **ravshan87** 2 years, 9 months ago

I take it back, C is the correct Answer. No braces are missing.

upvoted 2 times

Which two are benefits of polymorphism? (Choose two.)

- A. Faster code at runtime
- B. More efficient code at runtime
- C. More dynamic code at runtime
- D. More flexible and reusable code
- E. Code that is protected from extension by other classes

**Suggested Answer: BD**

BD (56%)

CD (44%)

 **Sudhakar\_Senthilkumar** 6 months ago

**Selected Answer: CD**

More Dynamic and Flexible

upvoted 1 times

 **netoplaxe** 1 year ago

CD is the correct Answer. In Enthware Exam-Pool you will find the same question and the correct answer which is CD

upvoted 1 times

 **dsms** 1 year, 10 months ago

**Selected Answer: BD**

B: More flexible and reusable code: Polymorphism makes code more flexible and reusable because it allows objects of different classes to be treated as if they are objects of the same class. This means that if you have a method that works with an object of a particular class, you can also use that method with objects of other classes that inherit from that class or implement the same interface. This can save a lot of time and effort because you don't have to write a separate method for each class.

upvoted 3 times

 **dsms** 1 year, 10 months ago

C: More dynamic code at runtime: Polymorphism makes code more dynamic at runtime because it allows the actual method that gets called to be determined at runtime rather than at compile time. This means that if you have a method that is overridden in a subclass, the version of the method that gets called will depend on the type of the object at runtime. This can lead to more flexible and powerful code that can adapt to different situations.

upvoted 5 times

 **dsms** 1 year, 10 months ago

made a misprint. I mean D, not C

upvoted 2 times

 **winfred\_lu** 1 year, 11 months ago

**Selected Answer: CD**

C: Method overriding is runtime polymorphism. The process in which call to the overridden method is resolved at runtime, also known as dynamic method dispatch.

D: Method overriding works together with inheritance to enable code reuse of existing classes without the need for re-compilation.

upvoted 4 times

 **anmoldev2java** 2 years, 7 months ago

why cant C

upvoted 2 times

 **iSnover** 2 years, 8 months ago

**Selected Answer: BD**

The correct answer is BD, not much to explain. Polymorphism makes the code more efficient in the sense that an object accesses features of the parent or child class and it also makes the code more flexible.

upvoted 2 times

Given the code fragment:

```
int nums1[] = {1, 2, 3};
int nums2[] = {1, 2, 3, 4, 5};
nums2 = nums1;
for (int x : nums2){
    System.out.print(x + ":");
}
```

What is the result?

- A. 1:2:3:4:5:
- B. 1:2:3:
- C. Compilation fails.
- D. An ArrayOutOfBoundsException is thrown at runtime.

false false

upvoted 1 times

Given the following classes:

```
public class Employee {
    public int salary;
}

public class Manager extends Employee {
    public int budget;
}

public class Director extends Manager {
    public int stockOptions;
}
```

And given the following main method:

```
public static void main(String[] args) {
    Employee employee = new Employee();
    Manager manager = new Manager();
    Director director = new Director();
    //line n1
}
```

Which two options fail to compile when placed at line n1 of the main method? (Choose two.)

- A. employee.salary = 50\_000;
- B. director.salary = 80\_000;
- C. employee.budget = 200\_000;
- D. manager.budget = 1\_000\_000;
- E. manager.stockOption = 500;
- F. director.stockOptions = 1\_000;

**Suggested Answer:** CE

 **DarGrin** 8 months, 3 weeks ago

**Selected Answer:** CE

C and E are correct

upvoted 1 times

 **ManuTov** 10 months, 1 week ago

Since budget is a member variable declared in the Manager class (subclass), instances of the Employee class (superclass) cannot directly access or modify the budget variable.

And stockOption does not exist.

upvoted 1 times

 **Vicky\_65** 1 year, 2 months ago

**Selected Answer:** CE

CE are the invalid.

upvoted 1 times

 **carloswork** 1 year, 8 months ago

**Selected Answer:** CE

Answer is CE.

To test:

```
class Employee {
    public int salary;
}
```

```
class Manager extends Employee {  
    public int budget;  
}
```

```
public class Director extends Manager {  
    public int stockOptions;
```

```
public static void main (String [] args ) {  
    Employee employee = new Employee();  
    Manager manager = new Manager();  
    Director director = new Director();
```

```
    employee.salary = 50_000; // A  
    director.salary = 80_000; // B  
    // employee.budget = 200_000; // C  
    manager.budget = 1_000_000; // D  
    // manager.stockOption = 500; // E  
    director.stockOptions = 1_000; // F
```

```
    System.out.println(employee.salary);  
    System.out.println(director.salary);  
    // System.out.println(stockOptions);  
    System.out.println(manager.budget);  
    // System.out.println(manager.stockOption);  
    System.out.println(director.stockOptions);  
}
```

upvoted 1 times

  **kkaayyyy** 1 year, 8 months ago

We cannot access variable budget by the object of employee and variable stockOptions by the object of manager as they lie in the child branch. Thus C and E are correct.

upvoted 1 times

  **shivkumarx** 1 year, 9 months ago

This question is not written correctly, the actual questions references all the objects using the Employee class

upvoted 1 times

Which one of the following code examples uses valid Java syntax?

- A.
- ```
public class Boat {

    public static void main (String [] args) {
        System.out.println  ("I float.");
    }

}
```
- B.
- ```
public class Cake {
    public static void main (String [] ) {
        System.out.println  ("Chocolate");
    }

}
```
- C.
- ```
public class Dog {
    public void main (String [] args) {
        System.out.println  ("Squirrel.");
    }

}
```
- D.
- ```
public class Bank {
    public static void main (String () args) {
        System.out.println  ("Earn interest.");
    }

}
```

A. Option A

B. Option B

C. Option C

D. Option D

Correct.

upvoted 11 times

 **dya45792** Highly Voted 4 years ago

Antwort A , ist richtig

```
public static void main(String[] args) {
    System.out.println(" I float. ");
}
}
```

upvoted 8 times

 **WeeChungus** Most Recent 7 months, 1 week ago

A is correct, but also C.

While C is not having the 'correct' static void main method, but the syntax itself is correct - which is asked.

The question itself leads to answer A and C

A is correct, C is not because there are round brackets after String - they should be square like A

upvoted 1 times

🗨️ 👤 **prabhatrai17** 1 year, 8 months ago

Selected Answer: A

only option A is correct. main method must be static. option C can't be right. since question itself asking choose one example that is valid.

upvoted 1 times

🗨️ 👤 **Anupam\_Anand** 1 year, 11 months ago

C is also correct what is wrong with C.

upvoted 2 times

🗨️ 👤 **carloswork** 1 year, 2 months ago

It has to be "static" otherwise it is treated as a normal method of the class, not a method for running the class.

So, needs to be - `public static void main (String[] args){}`

upvoted 2 times

🗨️ 👤 **abhi7597** 2 years, 2 months ago

the Correct Answer is A and C because in C you can define main method without static in it.

upvoted 4 times

Wrong question. Result: 2313

upvoted 32 times

 **abhayshitole** 3 months, 4 weeks ago

2413 is the correct answer.

Due to inner loop it will first print row 1 and then row 0.

Tested it.

upvoted 1 times

 **rasifer** Highly Voted 4 years, 11 months ago

Answer is:

2

3

1

3

(TESTED)

upvoted 12 times

 **TheeOne** Most Recent 4 months, 1 week ago

**Selected Answer: B**

Tested and got 2413

This creates a 2D array:

n[0] = {1, 3}

n[1] = {2, 4}

First for Loop (Reverse Iteration of n):

```
for (int i = n.length - 1; i >= 0; i--)
```

n.length is 2 (since it has two rows).

i starts at 1 (i.e., n.length - 1).

The loop runs from i = 1 down to i = 0.

Nested Enhanced for Loop (Iterating Over Each Row):

```
for (int y : n[i])
```

This iterates over each element in n[i].

Execution Order:

First Iteration (i = 1 → n[1] = {2, 4}):

for (int y : n[1]) prints:

2 4

Second Iteration (i = 0 → n[0] = {1, 3}):

for (int y : n[0]) prints:

1 3

**Selected Answer: A**

The correct is A, because m2 object variables x and y are not assigned so, these have default zero values. so the answer is 100:200:0:0 and you can test the code:

```
public class MyField {

    int x;
    int y;

    public void doStuffy(int x, int y) {
        x = x;
        y = this.y;
    }

    public void display () {
        System.out.print(x + " " + y + " : ");
    }

    public static void main(String[] args) {

        MyField m1 = new MyField ();
        m1.x = 100;
```

```

m1.y = 200;
MyField m2 = new MyField();
m2.doStuff(m1.x, m1.y);
m1.display();
m2.display();

```

```

}
}

```

**Selected Answer: A**

A is correct. Because for obj2 is obj1. So, if we assign i to obj2 .var it will change obj1 also.

upvoted 1 times

🗳️ 👤 **odzio33** 1 year, 4 months ago

**Selected Answer: A**

```
public class Vowel {
    private char var;
    public static void main (String[] args){
        char var1= 'a';
        char var2 = var1;
        var2 = 'e';
```

```
Vowel obj1 = new Vowel();
```

```
Vowel obj2 = obj1;
```

```
obj1.var = 'o';
```

```
obj2.var = 'i';
```

```
System.out.println(var1 + ", " + var2);
```

```
System.out.print(obj1.var + ", " + obj2.var);
```

```
}
```

```
}
```

a, e

i, i

upvoted 1 times

  **iSnover** 1 year, 9 months ago

**Selected Answer: A**

Answer is A and correct, because the obj2 is a same object of obj1 (Vowel obj2 = Vowel obj1), then when change obj2.var to 'i' changes too obj1.var to 'i'. Then print "a, e, i, i".

upvoted 1 times

Given the code fragment:

```
if (aVar++ < 10) {
    System.out.println(aVar + " Hello Universe!");
} else {
    System.out.println(aVar + " Hello World!");
}
```

What is the result if the integer aVar is 9?

- A. Compilation fails.
- B. 10 Hello Universe!
- C. 10 Hello World!
- D. 9 Hello World!

**Suggested Answer: B**

Community vote distribution

B (100%)

  **v323rs**  5 years, 5 months ago

The correct answer C

10 Hello World!

upvoted 8 times

  **iSnover**  2 years, 9 months ago

The corrent answer is B. Because when have "++" after of the variable as "aVar++" is added +1 when exit of the lace and i've tested the cod and return letter B.

boolean valueOf(string s)

The Boolean returned represents a true value if the string argument is not null and is equal, ignoring case, to the string "true"

<https://docs.oracle.com/javase/8/docs/api/java/lang/Boolean.html#valueOf-boolean->

Which means it returns false when a string is equal to "1"

upvoted 1 times

🗳️ 👤 **dsms** 1 year, 4 months ago

java Test 1 null

1 and null are Strings because args type is String[].

```
public static Boolean valueOf(String s) {  
    return parseBoolean(s) ? TRUE : FALSE;  
}
```

If the specified boolean is true, then the string "true" will be returned, otherwise the string "false" will be returned.

In this case, if the value is not true, all other String values return false.

**Selected Answer: C**

Answer is C.

Remember to run in command line "java Test 1 null".

```
boolean a = new Boolean(Boolean.valueOf(args[0]));
```

```
boolean b = new Boolean(args[1]);
```

```
System.out.println( a + " " + b );
```

upvoted 1 times

🗨️ 👤 **iSnover** 2 years, 3 months ago

**Selected Answer: C**

Correct is C, The default valor of a boolean type is false. When the valor is null, in boolean case, it is automatically transformed into false. In the line 2, as the boolean value was not started, so it is false too. Answer False False.

upvoted 4 times

🗨️ 👤 **Joker74** 2 years, 3 months ago

**Selected Answer: C**

if we pass other then true(equals ignore case) as a Boolean argument then it is referred as false.

upvoted 2 times

Given the code fragment:

```
public static void main(String[] args) {
    int[][] arr = new int [2] [4];
    arr[0] = new int []{1, 3, 5, 7};
    arr[1] = new int []{1, 3};
    for (int[] a : arr) {
        for (int i : a) {
            System.out.print(i+ " ");
        }
        System.out.println();
    }
}
```

What is the result?

- A. Compilation fails. B.  $\begin{matrix} 1 & 3 \\ 1 & 3 \end{matrix}$  C.  $\begin{matrix} 1 & 3 \\ \text{followed by an } \text{ArrayIndexOutOfBoundsException} \end{matrix}$  D.  $\begin{matrix} 1 & 3 \\ 1 & 3 & 0 & 0 \end{matrix}$  E.  $\begin{matrix} 1 & 3 & 5 & 7 \\ 1 & 3 \end{matrix}$

D is the correct answer

upvoted 1 times

Given:

```
class Animal {
    String type = "Canine";
    int maxSpeed = 60;

    Animal () {}

    Animal (String type, int maxSpeed) {
        this.type = type;
        this.maxSpeed = maxSpeed;
    }
}

class WildAnimal extends Animal {
    String bounds;

    WildAnimal (String bounds) {
        //line n1
    }

    WildAnimal (String type, int maxSpeed,String bounds) {
        //line n2
    }
}
```

And given the code fragment:

```
7. WildAnimal wolf = new WildAnimal("Long");
8. WildAnimal tiger = new WildAnimal("Feline", 80, "Short");
9. System.out.println(wolf.type + " " + wolf.maxSpeed + " " + wolf.bounds);
10. System.out.println(tiger.type + " " + tiger.maxSpeed + " " + tiger.bounds);
```

and this output:

Canine 60 Long -

Feline 80 Short -

Which two modifications enable the code to print this output? (Choose two.)

- A. . Replace line n1 with: `super ();`  
`this.bounds = bounds;`
- B. Replace line n1 with: `this.bounds = bounds;`  
`super ();`
- C. Replace line n2 with: `super (type, maxSpeed);`  
`this (bounds);`
- D. Replace line n1 with: `this ("Canine", 60);`  
`this.bounds = bounds;`
- E. Replace line n2 with: `super (type, maxSpeed);`  
`this.bounds = bounds;`

🗨️ 👤 **iSnover** 2 years, 9 months ago

**Selected Answer: AE**

The correct ones are A and E, you can eliminate the other options just for the syntax error. It is a question that does not need a complex analysis.

Always the "super()" or "super(var, var)" must come before "this" and it must be written "this.var = var;" anything outside of these other than instantiating by the class like "Animal.type t = type;" instead of the correct syntax of this is wrong.

upvoted 3 times

Given the code fragment:

```
public static void main (String [] args) {
    String names [] = ("Thomas", "Peter", "Joseph");
    String pwd [] = new String [3];
    int idx = 0;
    try {
        for (String n: names) {
            pwd [idx] = n.substring (2, 6);
            idx++;
        }
    }
    catch (Exception e) {
        System.out.println ("Invalid Name");
    }
    for (String p: pwd) {
        System.out.println (p);
    }
}
```

What is the result?

- |                 |                         |   |                        |
|-----------------|-------------------------|---|------------------------|
| A. Invalid Name | B. Invalid Name<br>omas | C. Invalid Name<br>omas<br>null<br>null | D. omas<br>ter<br>seph |
|-----------------|-------------------------|---|------------------------|

Suggested Answer: C

 **somrita90** 10 months, 1 week ago

It should be a compilation error, due to syntax, for this line

String names[] = ("Thomas", "Peter", "Joshep");

upvoted 2 times

 **yanoolthecool** 6 months, 3 weeks ago

keen eye

upvoted 1 times

 **Vicky\_65** 1 year, 2 months ago

C is correct

upvoted 1 times

 **carloswork** 1 year, 8 months ago

Correct. Answer is C.

In the first 'for', when trying to execute n.substring for the name "Peter", an exception will be thrown. So in the catch block it will print "Invalid Name", in the second 'for' it will print "omas" and the default values of the remaining elements of the pwd array.

It can be tested, iSnover give the source code below.

upvoted 1 times

 **iSnover** 1 year, 9 months ago

Correnct is C, there are no comments to make. If you want to test the code:

```
public class Main {
```

```
    public static void main(String[] args) {
```

```
String names [] = {"Thomas", "Peter", "Joseph"};  
String pwd [] = new String [3];  
int idx = 0;
```

```
try {  
    for (String n: names) {  
        pwd [idx] = n.substring(2, 6);  
        idx++;  
    }  
}  
catch (Exception e) {  
    System.out.println ("Invalid Name");  
}  
for (String p: pwd) {  
    System.out.println (p);  
}  
}  
upvoted 3 times
```

Given the code fragment:

```
class Employee {
    private String name;
    private int age;
    private int salary;

    public Employee (String name, int age) {
        setName (name)
        setAge (age)
        setSalary (2000);
    }
    public Employee (String name, int age, int salary) {
        setSalary (salary);
        this (name, age);
    }
    //getter and setter methods for attributes go here
    public void printDetails () {
        System.out.println (name + " : " + age + " : " + salary);
    }
}
```

Test.java -

```
class Test {
    public static void main(String[] args) {
        Employee e1 = new Employee();
        Employee e2 = new Employee("Jack", 50);
        Employee e3 = new Employee("Chloe", 40, 5000);

        e1.printDetails();
        e2.printDetails();
        e3.printDetails();
    }
}
```

Which is the result?

- A. Compilation fails in the Employee class. B. `Jack : 50 : 0`  
`Chloe : 40 : 5000` C. `Jack : 50 : 2000`  
`Chloe : 40 : 5000`  
 D. Compilation fails in the Test class.  
 E. Both the Employee class and the Test class fail to compile.

**Suggested Answer:** *E*

E is correct

upvoted 1 times

  **jackymak** 2 years, 1 month ago

**Selected Answer: E**

1. this(name, age) must be in the first line of the constructor.
2. No constructor for new Employee();

upvoted 3 times

🗨️ 👤 **akbiyik** 2 years, 7 months ago

this(name, age) must be in the first line of the constructor.

Since the Employee class defined two constructor, Employee class doesn't have anymore no-argument default constructor.

upvoted 3 times

🗨️ 👤 **carloswork** 2 years, 7 months ago

**Selected Answer: E**

Answer is E.

upvoted 1 times

🗨️ 👤 **anmoldev2java** 2 years, 7 months ago

**Selected Answer: A**

employee constructor itself will not compile because it calls this() not in the first line .. ultimately other class will not compile

upvoted 1 times

🗨️ 👤 **iSnover** 2 years, 9 months ago

**Selected Answer: E**

The correct answer is E, there are no comments to make. There are errors in the instantiation of the constructor in the first class, and in the other class, which is the execution class, it is calling the constructor that has an error, so the class cannot be started because it is also in error. The 2 files do not compile.

upvoted 1 times

Given the code fragments:

**A.java:**

```
package p1;
public class A {
}
```

**B.java:**

```
package p1.p2;
//line n1
public class B {
    public void doStuff() {
        A b = new A();
    }
}
```

**C.java:**

```
package p3;
//line n2
public class C {
    public static void main(String[] args) {
        A o1 = new A();
        B o2 = new B();
    }
}
```

Which modification enables the code to compile?

A.

Replace line n1 with:  
import p1.\*;  
Replace line n2 with:  
import p1.p2.\*;

B.

Replace line n1 with:  
import p1. A;  
Replace line n2 with:  
import p1.\*;

C.

Replace line n1 with:  
import p1. A;  
Replace line n2 with:  
import p1. A;  
import p1.p2.B ;

D.

Replace line n1 with:  
import p1;  
Replace line n2 with:  
import p1;  
import p1.p2;

I do not understand p1. p2.B ??

I only see p2.B or p2.\*

upvoted 1 times

Given:

```
class A {
    public void test () {
        System.out.println ("A");
    }
}
class B extends A {
    public void test () {
        System.out.println ("B");
    }
}
public class C extends A {
    public void test () {
        System.out.println ("C");
    }
}

public static void main (String [] args) {
    A b1 = new A ();
    A b2 = new C ();

    b1 = (A) b2;           //line n1
    A b3 = (B) b2;         //line n2
    b1.test ();
    b3.test ();
}
```

What is the result?

- A. A B
- B. A C
- C. C C
- D. A ClassCastException is thrown only at line n1.
- E. A ClassCastException is thrown only at line n2.

**Suggested Answer: B**

Community vote distribution

E (100%)

 **iSnover** Highly Voted 2 years, 9 months ago

**Selected Answer: E**

The right answer is the letter E, class C cannot be B because B extends A and C also extends C, there is no inheritance between C and B because neither of the 2 classes extends the other, generating the exception Class Cast Exception on the line 2 where trying to perform the polymorphism of C -> B. I also tested the code, if you want to test it too it is below:

```
class A {
    public void test () {
        System.out.println ("A");
    }
}
```

```
class B extends A {
    public void test () {
        System.out.println ("B");
    }
}
```

```

public class C extends A {

    public void test () {
        System.out.println ("C");
    }

    public static void main(String[] args) {
        A b1 = new A ();
        A b2 = new C ();

        b1 = (A) b2; //line n1
        A b3 = (B) b2; //line n2

        b1.test ();
        b3.test ();
    }
}

```

Correct answer should be B as overloaded methods have int and double argument types

upvoted 4 times

You are asked to create a method that accepts an array of integers and returns the highest value from that array.

Given the code fragment:

```
class Test{
    public static void main(String[] args) {
        int numbers[] = {12, 13, 42, 32, 15, 156, 23, 51, 12};
        int[] keys = findMax(numbers);
    }

    /* line n1 */ {
        int[] keys = new int[3];
        /* code goes here*/
        return keys;
    }
}
```

Which method signature do you use at line n1?

- A. public int findMax (int[] numbers)
- B. static int[] findMax (int[] max)
- C. static int findMax (int[] numbers)
- D. final int findMax (int[] )

**Suggested Answer: C**

correct answer is B

upvoted 1 times

🗳️ 👤 **7df49fb** 1 year, 3 months ago

Don't be confused !!

method : access modifier optional specifier return type method name (parameters)

static int findMax(int[])

static : because, the method is used directly in a static main method (the method exist alone without instanciating the class Test)

int : return type, we want just the maximum int value from the array

int[]: the method takes an array of int.

Question #96 is an example for D

upvoted 1 times

Given the code fragment:

```
Public static void main (String [] args) {  
    System.out.println ("Result A " + 0 + 1);  
    System.out.println ("Result B " + (1) + (2) );  
}
```

What is the result?

A.

```
Result A 01  
Result B 3
```

B.

```
Result A 1  
Result B 12
```

C.

```
Result A 1  
Result B 3
```

D.

```
Result A 01  
Result B 12
```

**Suggested Answer:** *D*

 **iSnover** Highly Voted 1 year, 3 months ago

Correct is D. To be 3, in second line needs (1 + 2) and not "(1) + (2)" or "1 + 2". When have String + in "Println", the numbers need to sum be in an expression without non-primitive types or be enclosed in parentheses also without non-primitive types. When you have a non-primitive type together with a primitive in println, concatenation is done. Here's the logic of the expression:

Result + (1) + (2)

Result + 1 + 2

Result 12

upvoted 6 times

 **spongecodes** Most Recent 9 months, 2 weeks ago

Java expressions are left associative so entire expression is evaluated as String so D

upvoted 2 times

 **kkaayyyy** 1 year, 2 months ago

It's D.

Result A is 01

Result B is 12

upvoted 3 times

Given:

```
public class App {  
    int count;  
    public static void displayMsg () {  
        count++; // line n1  
        System.out.println ("Welcome "+"Visit Count: "+count); // line n2  
    }  
    public static void main (String [] args) {  
        App.displayMsg (); // line n3  
        App.displayMsg (); // line n4  
    }  
}
```

What is the result?

- A. Compilation fails at line n3 and line n4.
- B. Compilation fails at line n1 and line n2.
- C. Welcome Visit Count:1 Welcome Visit Count: 1
- D. Welcome Visit Count:1 Welcome Visit Count: 2

**Suggested Answer: B**

🗳️ **IbrahimAlnutayfi** 2 years ago

**Selected Answer: B**

The answer is B  
upvoted 1 times

🗳️ **eilla** 2 years, 7 months ago

Correct answer is B.

A static method can only reference other static methods and static fields. Count is non static and therefore produces "error: non-static variable count cannot be referenced from a static context"

I initially thought App.displayMessage() was the issue because an app object hadn't been instantiated. However here app is not an object but rather a class reference to a static method. Static fields do not need an object of that class in order to be used.

This error could also be fixed by making displayMessage non static and creating an app object to reference the method from in main

```
public class App {  
    int count;  
    public static void displayMessage() {  
        count++;  
        System.out.println("Welcome. Visit count: " + count);  
    }  
}
```

```
}  
public static void main(String[] args) {  
    App.displayMessage();  
    App.displayMessage();  
}  
}
```

upvoted 2 times

  **iSnover** 2 years, 9 months ago

**Selected Answer: B**

Correct B is Answer. Because you cannot make a static reference to the non-static field count. To make codes comply need to change "count" into a static variable as "static int count".

upvoted 3 times

Given the code fragment:

```
public class Person {
    String name;
    int age = 25;

    Person(String name) {                // line n1
        setName(name);
    }

    public Person(String name, int age) {    // line n2
        Person(name);
        setAge(age);
    }

    //setter and getter methods go here

    public String show() {
        return name + " " + age;
    }

    public static void main(String[] args) {
        Person p1 = new Person("Jesse");
        Person p2 = new Person("Walter", 52);
        System.out.println(p1.show());
        System.out.println(p2.show());
    }
}
```

What is the result?

- A. Compilation fails at both line n1 and line n2.
- B. Compilation fails only at line n2.
- C. Compilation fails only at line n1.
- D. Jesse 25 Walter 52

**Suggested Answer: A**

 **eilla** 1 year, 7 months ago

Answer is B.  
Correct syntax for the second constructor to call the first would be to use this(name).  
upvoted 3 times

 **carloswork** 1 year, 7 months ago

**Selected Answer: B**

Answer is B.

To test:

```
class Person {
    String name;
    int age = 25;
```

```
Person (String name) { // line 1
```

```
setName(name);
```

```
}
```

```
public Person (String name, int age) {
```

```
Person(name); // line 2
```

```
setAge(age);
```

```
}
```

```
// setter and getter methods go here
```

```
public void setName (String name) { this.name = name; }
```

```
public void setAge (int age) { this.age = age; }
```

```
public String show() {
```

```
return name + " " + age;
```

```
}
```

```
}
```

```
public class Teste {
```

```
public static void main(String[] args) {
```

```
Person p1 = new Person("Jesse");
```

```
Person p2 = new Person("Walter",52);
```

```
System.out.println(p1.show());
```

```
System.out.println(p2.show());
```

```
}
```

```
}
```

upvoted 2 times

  **iSnover** 1 year, 9 months ago

**Selected Answer: B**

Correct Answer is B, the line 1 compiles normally and execute because even though the constructor is not public, the main method is in the same class and can be seen to be instantiated. On line 2, the constructor is wrong because a method is being used inside it.

upvoted 3 times

  **shivkumarx** 1 year, 9 months ago

Question is written wrong here, compilation only fails at n2

upvoted 2 times

Given the code fragment:

```
public class Test {  
  
    static int count = 0  
    int i = 0;  
  
    public void changeCount () {  
        while (i<5) {  
            i++;  
            count++;  
        }  
    }  
  
    public static void main (String [] args) {  
        Test check1 = new Test ();  
        Test check2 = new Test ();  
        check1.changeCount ();  
        check2.changeCount ();  
        System.out. print (check1.count + " : " + check2.count);  
    }  
}
```

What is the result?

- A. 5 : 5
- B. 10 : 10
- C. 5 : 10
- D. Compilation fails.

Suggested Answer: B

Version - JDK 1.8.0\_66

Your Code ...

```
1 public class Test {
2
3     static int count = 0 ;
4     int i = 0;
5
6     public void changecount () {

The correct answer B

10 10

upvoted 10 times

 **KeletsoM23** Most Recent 11 months, 4 weeks ago

compilation will fail due to a missing ;. but if we replace that semi colon and run it, the out out will be 10:10

upvoted 1 times

 **carloswork** 1 year, 7 months ago

Selected Answer: B

Answer is B.

To test:

```
public class Test {
    static int count = 0;
    int i = 0;
```

```
    public void changeCount() {
        while(i<5) {
            i++;
            count++;
        }
    }
}
```

```

public static void main (String [] args) {
Test check1 = new Test ();
Test check2 = new Test ();
check1.changeCount();
check2.changeCount();
System.out.print(check1.count + " : " + check2.count);
}
}

```

🗳️ 👤 **hackGh** 3 years, 7 months ago

b

10:10 count is static

upvoted 2 times

Given the code fragment:

```
public static void main(String[] args) {  
    ArrayList<Integer> points = new ArrayList<>();  
    points.add(1);  
    points.add(2);  
    points.add(3);  
    points.add(4);  
    points.add(null);  
    points.remove(1);  
    points.remove(null);  
    System.out.println(points);  
}
```

What is the result?

- A. A NullPointerException is thrown at runtime.
- B. [1, 2, 4]
- C. [1, 2, 4, null]
- D. [1, 3, 4, null]
- E. [1, 3, 4]
- F. Compilation fails.

**Selected Answer: E**  
points.remove(null) makes a call to remove(Object).

ArrayList class provides two overloaded remove() methods.

remove(int index): Accepts the index of the object to be removed

remove(Object obj): Accepts the object to be removed

Answer is [ 1, 3, 4 ]

upvoted 1 times

🗉 👤 **iSnover** 1 year, 9 months ago

The right answer is the letter E, because the number 1 is added in the second line of the list, but the list indexes from 0, so the 1 is in position zero and the removal done in line 7 removes the data in position 1 of the list which is 2. Remembering that you cannot give the NullPointerException because lists can print null if it is inserted in one of the positions of the list, it would only give NullPointerException if the list was empty. If you have any doubts, I'll also test the code, feel free:

```
public static void main(String[] args) {  
    ArrayList<Integer> points = new ArrayList<>();  
    points.add(1);  
    points.add(2);  
    points.add(3);  
    points.add(4);  
    points.add(null);  
    points.remove(1);  
    points.remove(null);  
    System.out.println(points);  
}
```

upvoted 2 times

🗉 👤 **praroopgupta** 1 year, 9 months ago

Correct answer should be [1,3,4]

upvoted 3 times

Given:

```
class Test {  
    public static void main (String [] args) {  
        int numbers [ ];  
        numbers = new int [2];  
        numbers [0] = 10;  
        numbers [1] = 20;  
  
        numbers = new int [4];  
        numbers [2] = 30;  
        numbers [3] = 40;  
        for (int x : numbers) {  
            System.out.print (" " + x) ;  
        }  
    }  
}
```

What is the result?

- A. 10 20 30 40
- B. 0 0 30 40
- C. Compilation fails.
- D. An exception is thrown at runtime.

B is correct because the new() means that the reference will point to a other object in the heap  
upvoted 2 times

  **akbiyik** 2 years, 7 months ago

**Selected Answer: B**

Each class variable, instance variable, or array component is initialized with a default value when it is created. For example;

```
int[] intArray = new int[10];
```

This allocates the memory for an array of size 10. This size is immutable.

Java populates our array with default values depending on the element type - 0 for integers, false for booleans, null for objects, etc. Let's see more of how we can instantiate an array with values we want.

The slow way to initialize your array with non-default values is to assign values one by one:

**Selected Answer: B**

Answer is B.

To test:

```
public static void main(String[] args) {  
    int numbers[];  
    numbers = new int[2];  
    numbers [0] = 10;  
    numbers [1] = 20;  
  
    numbers = new int [4];  
    numbers [2] = 30;  
    numbers [3] = 40;  
    for (int x : numbers) {  
        System.out.println(" " + x);  
    }  
}
```

upvoted 1 times

🗲️ 👤 **iSnover** 2 years, 9 months ago

**Selected Answer: B**

The correct one is B, because a new reference is given to the numbers list, which overwrites the old one and 30 is added to position 2 and 40 to position 3 of the list, as it was reset, position 0 and 1 had no numbers, so they won the value of 0 because when an int has no reference to a number, 0 is given for the pattern, so when printing the list it outputs "0 0 30 40"

Which two code fragments cause a compilation error? (Choose two.)

- A. float flt = 100.00F;
- B. float flt = (float) 1\_11.00;
- C. Float flt = 100.00;
- D. double y1 = 203.22; float flt = y1;
- E. int y2 = 100; float flt = (float) y2 ;

Example 2;

```
import java.util.Arrays;
import java.util.Scanner;
public class ArrayDefaultValues {
```

```

int intArray[] = new int[3];
float floatArray[] = new float[3];
byte byteArray[] = new byte[3];
boolean boolArray[] = new boolean[3];
String stringArray[] = new String[3];
public static void main(String args[]){
    ArrayDefaultValues obj = new ArrayDefaultValues();
    System.out.println(Arrays.toString(obj.intArray));
    System.out.println(Arrays.toString(obj.floatArray));
    System.out.println(Arrays.toString(obj.byteArray));
    System.out.println(Arrays.toString(obj.boolArray));
    System.out.println(Arrays.toString(obj.stringArray));
}
}

```

Output

[0, 0, 0]

[0.0, 0.0, 0.0]

[0, 0, 0]

[false, false, false]

[null, null, null]

upvoted 1 times

  **carloswork** 1 year, 7 months ago

**Selected Answer: CD**

Answer is CD.

To test, uncomment one option at a time in the IDE and check the error.

```

public static void main(String[] args) {
    //float flt = 100.00F; // A - Ok
    //float flt = (float) 1_11.00; // B - Ok
    //Float flt = 100.00; // C - Error - need cast to Float.
    //double y1 = 203.22; float flt = y1; // D - Error - need cast to float.
    //int y2 = 100; float flt = (float) y2 ; // F - Ok
}

```
