ACME Corporation employees access critical business web applications through CyberArk Identity. You notice a constant high volume of unauthorized traffic from 103.1.200.0/24 trying to gain access to the CyberArk Identity portal. Access to the CyberArk Identity portal is time sensitive. ACME decides to enforce IP restrictions to reduce vulnerability.

Which configuration can help achieve this?

- A. Log in to the CyberArk Identity Admin portal and define the IP range of 103.1.200.0/24 into the ACME Corporation IP range.
- B. Log in to the CyberArk Identity Admin portal and define the IP range of 103.1.200.0/24 into the blocked IP range.
- C. Implement device trust through the Windows Cloud Agent.
- D. Implement zero trust through the App Gateway.

Refer to the exhibit.

Which statements are correct regarding this Authentication Policy? (Choose two.)

## Authentication Policy for CyberArk Identity

Applies to all web logins to CyberArk Identity, including the Admin and User Portal and on-demand

### Other Settings

- Continue with additional challenges after failed challenge
- Do not send challenge request when previous challenge response failed

- A. Users will still be asked for their MFA even if they mistyped their username.
- B. If users have set up CyberArk Mobile Authenticator as an MFA, they will still receive the Push Notification to confirm the request even if they mistyped their password.
- C. Users will not be notified which challenge they failed if their login attempt failed.
- D. If users have set up a Security Question as an MFA, the Security Question will not be displayed to the user to answer even if they mistyped their password.
- E. If the first factor is password and the user is an Active Directory user and the Active Directory is unavailable, this setting does not matter because the user will not be able to authenticate through Active Directory credentials and will see the message "Active Directory not available".

When configuring an application to use the App Gateway, you do not have to change any configurations in the application directly. You enable the application for App Gateway access in the Admin Portal and input the existing URL that users enter to open the application. You can either use an external URL that CyberArk Identity automatically generates, or you can continue using an existing internal URL.

What is a disadvantage of using an existing internal URL for App Gateway connections?

- A. Existing links and bookmarks do not work outside of the corporate network.
- B. Users must use different URLs depending on whether they access the application internally or externally.
- C. More configuration is needed because you must upload the URL certificate and private key, and edit DNS settings.
- D. Users must use the same URLs regardless of whether they access the application internally or externally and this may confuse them.

**Suggested Answer:** C
