upvoted 1 times

☐ 👤 **Benojojo** 2 years, 2 months ago

Copied from the provided link, "Update sets work in scoped apps just like they do in global scope. But there is a better way to move scoped apps from one instance to another. This capability is called "publish" and it allows you to move an application just like you would with a single executable. The publish capability checks for dependencies and locks the application in the instance where it has been moved so that no changes can be made". for option B

Which of the following is NOT a trigger type in Flow Designer?

    A. Outbound Email

    B. Application

    C. Record

    D. Schedule

Suggested Answer: *A*

Community vote distribution

A (100%)

⊟ 👤 **f27ad55** 2 months, 2 weeks ago

A is the correct answer.
These are the triggers for a Flow in ServiceNow:

Record
-Created
-Updated
-Created or Updated

Scheduled
-Daily
-Weekly
-Monthly
-Run once
-Repeat

Application
-SLA Task
-Inbound Email
-Service Catalog

   upvoted 1 times

B is the right answer. See the "NOT" in the question.

upvoted 2 times

⊟ 👤 **sg_100** 1 year, 9 months ago

B! (Ref Tokyo Documentation)

Notifications that have the same target table and recipients are considered duplicates if the weights are different. If weights are same, an additional evaluation is done to check if the subject and the body (excluding watermark) are same to qualify as duplicate notification. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met).

But the problem is, that g_scratchpad is also not available in Async BR...

upvoted 2 times

🔲 👤 **Ricou** 1 year, 5 months ago

Selected Answer: A

Business Rules often use the current and previous objects in their script logic.

The current object is automatically instantiated from the GlideRecord class. The current object's properties are all the fields for a record and all the GlideRecord methods. The property values are the values as they exist in the runtime environment.

The previous object is also automatically instantiated from the GlideRecord class. The previous object's properties are also all fields from a record and the GlideRecord methods. The property values are the values for the record fields when they were loaded from the database and before any changes were made. The previous object is not available for use in async Business Rules.

upvoted 1 times

🔲 👤 **Bob_Loblaw** 1 year, 11 months ago

A. Incorrect. "Catalog Type" is not a standard Link type for modules in ServiceNow.

B. Incorrect. "Assessment" and "Timeline Page" are not standard Link types for modules in ServiceNow.

C. Correct. This option includes standard Link types for modules in ServiceNow:

List of Records: Displays a list of records from a specified table.
Content Page: Links to a ServiceNow content page.
Order: Represents an ordering of items (a separator that organizes other modules).
URL (from arguments): Allows you to link to an external URL.
D. Incorrect. "Assessment" is not a standard Link type for modules in ServiceNow.

When working in the Form Designer, configuring the label of a field in a child table changes the label on which table(s)?

A. base table

B. child table

C. parent table

D. all tables

Suggested Answer: *B*

Community vote distribution

B (100%)

⊟ 👤 **sahithi2004** 4 months, 2 weeks ago

Selected Answer: B

When working in the Form Designer in ServiceNow, configuring the label of a field in a child table changes the label on:

B. child table

This means that the label change will only apply to the child table where you made the modification, not affecting the base table, parent table, or all tables.

upvoted 1 times

⊟ 👤 **jck777** 5 months, 1 week ago

c. Parent table

from servicnow support documentation: If a child table, such as pm_project, is saved using the form designer, the parent field labels (sys_documentation) are changed to those of the child. For example, changing and saving the pm_project form causes the short_description field label on task to change from "Short Description" to "Project Name."

upvoted 1 times

⊟ 👤 **D_Ogi** 10 months, 3 weeks ago

A (54%)	C (46%)

🔲 👤 **nsmcan** `Highly Voted 👍` 3 years, 1 month ago

Correct answer is A. I didn't find any definite statements about order in the docs. However in the link, quoted for this question, there are two opposite responses. One, which takes UI Policy Actions first and UI Policy Scripts second, was marked helpful by ServiceNow and Expert(s)

upvoted 13 times

🔲 👤 **Haikz** `Highly Voted 👍` 2 years, 6 months ago

`Selected Answer: A`

A is correct, verified.

Created UI policy on incident form, action set's cmdb_ci field as mandatory and script as not. result, field was not mandatory.

upvoted 9 times

🔲 👤 **RoadtoCad** `Most Recent ⊘` 3 months, 1 week ago

The answer is A

Actions execute first: When a UI Policy is triggered, the Actions are applied first. This ensures that the form is updated (fields are shown, hidden, made mandatory, etc.) before any custom scripts are run.

Scripts execute after Actions: Once the Actions have been applied, the UI Policy Scripts are then executed. This allows the script to work with the form in its updated state.

upvoted 1 times

🔲 👤 **DKey** 4 months ago

A. tested in PDI

C
UI Policy's Scripts execute before the UI Policy's Actions (Option C): This statement is accurate. When a UI Policy is triggered, its script runs first.
The script evaluates conditions and performs any necessary modifications. If the conditions are met, the associated actions (such as hiding fields
or setting field values) are then executed.

upvoted 1 times

 Checwes 8 months, 2 weeks ago

Selected Answer: A

Just tested in my PDI.

Sample example:

1) on incident form write UI policy when state changes to closed; make short description as mandatory from UI policy action

2) from UI policy script execute if true; use below script

g_form.setMandatory('short_description', false);

Answer is A.

upvoted 1 times

 manikanta_gnbv 8 months, 2 weeks ago

Selected Answer: C

I think the answer is C

upvoted 3 times

 MacGyver4th 10 months ago

Selected Answer: C

I tested this on the incident form in a Vancouver PDI by modifying the "Fields set to mandatory for all states" UI policy.

I changed the "When to Apply" condition to when the state was "In Progress"
I enabled "Run scripts" and added code in the "Execute if true" section
I keep getting bad gateway errors when I try to submit with the code

When the form loads, the caller and short descriptions fields are not mandatory. When I select "In Progress" for the state, after about 5 seconds
the caller and short description fields become mandatory.

This tells me that the script runs before the actions.

The answer is C

upvoted 3 times

 evoken 10 months, 2 weeks ago

In ServiceNow, UI Policies are used to dynamically change the behavior of form elements based on certain conditions. A UI Policy consists of both Scripts and Actions.

Scripts: These are JavaScript code snippets that execute when the conditions specified in the UI Policy are met. They are typically used for more complex logic and calculations.

Actions: These are predefined operations that can be applied to form elements when the conditions are met. Examples include showing or hiding a field, making a field mandatory, or setting a default value.

The correct order of execution is that the Scripts execute before the Actions. The JavaScript code in the Scripts section is evaluated first, and based on the results, the corresponding Actions are then executed.

So, option C is the correct statement.

Notice the template syntax. The function syntax is known in JavaScript as a self-invoking function or an Immediately Invoked Function Expression (IIFE). The function is immediately invoked after it is defined. ServiceNow manages the function and when it is invoked; developers do not explicitly call Business Rule scripts.

When you pass an event, you pass a record and two parameters, this does not ask if you want to access the parameters, which would need the ${event.parm1} syntax, but it asks to access the proparties of the event, which would be the record being passed with it. which can be accessed by using the field name directly. so ${property_name} would work, and so should ${property_name.getDisplayValue} to get its display value instead of actual value. the trigger for an event is gs.eventQueue(<EVENT NAME>, <RECORD OBJECT>, PARM1, PARM2) you can access a field within the record object by simply using ${field_Name}

g_user can be used on Client Side Scripts:

1. Client Script

2. UI Policy Script

3. UI Action (if client checkbox is true)

  upvoted 1 times

👤 **hawful** 1 year, 4 months ago

Selected Answer: C

The correct answer is C, although GlideUser is not COMMONLY used in UI Actions, you can make a UI Action run client side. Running a UI action client side is also how you integrate GlideModal and other client operations with a UI Action.

Tricky question, but the answer is C.

  upvoted 2 times

👤 **luissevero** 1 year, 6 months ago

Search in the doc UTAH version: "is typically used in client scripts and UI policies but is also found in UI actions that run on the client."

So, the correct answer is C.

  upvoted 1 times

👤 **schaparro** 1 year, 6 months ago

Selected Answer: A

The link being shared says that the GlideUser API cannot be used in UI actions that run on the server. This question doesn't specify if the UI Action runs on the client or on the server. For that reason, I believe the correct answer is A. The GlideUser is typically used in client scripts and UI policies. Unless it is specified where the UI Action is running I will not assume is on the client side. A very tricky question indeed.

upvoted 3 times

snguru 1 year, 6 months ago

"CAN" is a key word interpretation that needs to be understood for this question.

"Can be used in Client Scripts, UI Policies, and UI Actions" as is mentioned below. Read these details carefully.

upvoted 1 times

REENA124 1 year, 10 months ago

GlideUser

The GlideUser API provides access to information about the current user and current user roles. Using the GlideUser API avoids the need to use the slower GlideRecord queries to get user information.

The GlideUser methods and properties are accessed through a global object (g_user) that is only available in client scripts. GlideUser contains name and role information about the current user.

is typically used in client scripts and UI policies but is also found in UI actions that run on the client.

cannot be used in business rules or UI actions that run on the server.

When configuring a module, what does the Override application menu roles configuration option do?

A. Users with the module role but without access to the application menu access the module

B. Self-Service users can access the module even though they do not have roles

C. Admin is given access to the module even if Access Controls would ordinarily prevent access

D. Users with access to the application menu can see the module even if they don't have the module role

Suggested Answer: *A*

Community vote distribution

A (100%)

👤 **nsmcan** `Highly Voted 👍` 3 years, 1 month ago

Correct answer is A.

The reference link, provided for the question, confirms that: Override application menu roles : Allows users to access this module even if they do not have permission to view the containing application menu. Users must still meet the role requirements for this module.

`Selected Answer: A`

A is correct

upvoted 1 times

👤 **MagdaGrs** 1 year, 3 months ago

`Selected Answer: A`

Use the Override application menu roles option to give module-level access to a role that is not authorized to see the application.

For example, assume the Special Occasions application menu requires the admin role and the Occasions module for the Special Occasions application requires the x_snc_employee_spe.occasions_user role.

The application-level requirement supersedes the module-level requirement which means that users with the x_snc_employee_spe.occasions_user role cannot see either the application or the module.

If the Override application menu roles option is selected, users with the x_snc_employee_spe.occasions_user role can see both the application and the module even though the user is not authorized by role to see the application menu.

Which platform feature can be used to determine the relationships between field in an Import Set table to field in an existing ServiceNow table?

A. Business Service Management Map

B. Data Sources

C. Transform Map

D. CI Relationship Builder

Suggested Answer: *C*

A transform map determines the relationships between fields displaying in an Import Set table and fields in an existing ServiceNow table, such as the Incidents or

Users table.

Answer :C

upvoted 9 times

👤 **MagdaGrs** `Most Recent ⊘` 1 year, 3 months ago

`Selected Answer: C`

Whenever a session requests data, the system searches for access control rules that match the requested object and operation. If there is a matching access control rule, then the system evaluates if the user has the permissions required to access the object and operation. If an access control rule specifies more than one permission, then the user must meet all permissions to gain access to the object and operation. Failing any one permission check prevents the user from accessing the matching object and operation.

If a user does not meet the permissions of the first matching rule, the system evaluates the permissions of the next matching access control rule as specified by the access control processing order. If the user fails to meet the permissions of any matching access control rule, the system denies access to the requested object and operation.

Selected Answer: A

Explanation:

Business problem - If you are not solving a business problem, you do not need an application.

Stakeholders - Requestor and Fulfiller, Application Administrator , Management.
Users - Personas largely equate to Roles in ServiceNow.

Inputs - can take many forms such as Users, spreadsheets, and web services.
Outputs: can also take many forms such as dashboards, reports, and email.

Process Steps - There are many strategies for defining a process, such as SIPOC(Six Sigma), ASME Standard for Process Charts, and others. Choose a strategy that works well for you.

Which objects can be used in Inbound Action scripts?

    A. current and previous

    B. current and email

    C. current and event

    D. current and producer

Suggested Answer: *B*

Community vote distribution

B (93%) | 7%

⊟ 👤 **kundgir** `Highly Voted 👍` 3 years, 1 month ago
Should be B. There is no access to event in inbound action
   upvoted 14 times

⊟ 👤 **Jyoti18** `Highly Voted 👍` 2 years, 6 months ago
Technically both B and C are correct:

(function runAction(/*GlideRecord*/ current, /*GlideRecord*/ event, /*EmailWrapper*/ email, /*ScopedEmailLogger*/ logger) {

// Implement email action here

})(current, event, email, logger);
   upvoted 14 times

⊟ 👤 **RoadtoCad** `Most Recent ⊘` 2 months, 3 weeks ago
`Selected Answer: C`
Both B and C are correct:

(function runAction(/*GlideRecord*/ current, /*GlideRecord*/ event, /*EmailWrapper*/ email, /*ScopedEmailLogger*/ logger) {

// Implement email action here

})(current, event, email, logger);
   upvoted 1 times

⊟ 👤 **MacGyver4th** 10 months ago
I agree that B and C are correct.
As Jyoti18 pointed out, the available objects are:
current, event, email, logger, classifier)

This the function that populates in my Vancouver PDI:
(function runAction(/*GlideRecord*/ current, /*GlideRecord*/ event, /*EmailWrapper*/ email, /*ScopedEmailLogger*/ logger, /*EmailClassifier*/ classifier) {

// Implement email action here

})(current, event, email, logger, classifier);
   upvoted 1 times

⊟ 👤 **fe91db0** 11 months, 4 weeks ago
`Selected Answer: B`
event is deprecated
   upvoted 3 times

⊟ 👤 **IT4life** 1 year, 1 month ago

You cannot use current and email in Inbound Action scripts. The current and email objects are only available in the context of an inbound email action. The current and previous objects are the only objects available in Inbound Action scripts for the following reasons:

(1) The current and previous objects allow you to access the current and previous records in the context of an inbound email action.

(2) The current and previous objects are the only objects that contain information about the email message that triggered the inbound email action.

(3) The current and previous objects are the only objects that contain information about the records that are associated with the email message that triggered the inbound email action.

(4) The current and previous objects are the only objects that contain information about the user who sent the email message that triggered the inbound email action.

(5) The current and previous objects are the only objects that contain information about the inbound email action that was triggered by the email message.

Therefore, the current and previous objects are the only objects used in Inbound Action scripts for this reason.The correct answer is A

Selected Answer: B

event is deprecated in inbound email action
upvoted 3 times

⊟ 👤 **_Susan_** 1 year, 8 months ago

B and C are correct: https://docs.servicenow.com/bundle/tokyo-servicenow-platform/page/administer/notification/task/t_CreatingAnInboundEmailAction.html
upvoted 2 times

⊟ 👤 **fivani** 1 year, 8 months ago

Selected Answer: B

Definitely B - current and email

"event" really has no purpose as inbound email actions are always triggered by "email.read".
upvoted 3 times

⊟ 👤 **Zolly** 1 year, 9 months ago

Utah PDI: When checking System Policy > Email > Inbound Actions and creating new Inbound action

The function runAction() Has parameters current,event,email

However event is striked and marked as deprecated, thats why B is correct.
upvoted 6 times

⊟ 👤 **SergioVSJ** 1 year, 10 months ago

Selected Answer: B

Correct answer is B.
Event is a parameter of the function, that gives access one of the parameters of the originating event. For example, event.parm1 accesses the first parameter of the event or event.parm2 for the second parameter.
Inbound actions are not generated by an event.

D (75%) | B (25%)

👤 **Ashtan1985** `Highly Voted 👍` 2 years, 7 months ago

Correct answer is D. When Accessible from is set to "This app scope only", then "Allow configuration" is unchecked and read-only

upvoted 10 times

👤 **manikanta_gnbv** `Most Recent ⏱` 8 months, 2 weeks ago

`Selected Answer: B`

B is the correct answer.

upvoted 1 times

👤 **MacGyver4th** 10 months ago

`Selected Answer: D`

Just tested this in a Vancouver PDI.

When selecting "This application scope only", all the check boxes are cleared and become read-only.

upvoted 3 times

👤 **ravidamarla** 1 year, 1 month ago

B is correct answer

upvoted 1 times

👤 **Dekoreh** 1 year, 2 months ago

`Selected Answer: D`

D is correct.

upvoted 1 times

👤 **MagdaGrs** 1 year, 3 months ago

`Selected Answer: D`

To prevent all other app scopes, simply select "This application scope only".

upvoted 1 times

👤 **Vishalvr** 1 year, 7 months ago

`Selected Answer: D`

D is the best option. B is also correct in a way but since one option only, can select D

upvoted 2 times

👤 **SergioVSJ** 1 year, 10 months ago

`Selected Answer: D`

Correct answer is D.

Check the following 2 examples of denying and granting access.

https://docs.servicenow.com/bundle/tokyo-application-development/page/build/applications/concept/c_ExampleDenyingAllRuntimeAccess.html

https://docs.servicenow.com/bundle/tokyo-application-development/page/build/applications/concept/c_ExampleGrantingAllRuntimeAccess.html

upvoted 2 times

👤 **Ghostrunner** 1 year, 11 months ago

I would say both B and D could be correct, however, D would also disable the read/update/delete, not just the create function. The question isn't clear whether the table should still be readable by others or not.

⊟ 👤 **ParagSanyashiv** 2 years, 10 months ago

Selected Answer: B

B is the correct answer

upvoted 3 times

What are some of the benefits of extending an existing table such as the Task table when creating a new application? a) You can repurpose existing fields by simply changing the label. b) Use existing fields with no modifications. c) Existing logic from the parent table will be automatically applied to the new table. d) All of the parent table records are copied to the new table.

    A. a, b, c, and d

    B. a and b

    C. b and c

    D. a, b, and c
