

- Expert Verified, Online, **Free**.

A Visualforce page loads slowly due to the large amount of data it displays.

Which strategy can a developer use to improve the performance?

- A. Use Javascript to move data processing to the browser instead of the controller.
- B. Use the transient keywords for the List variables used in the custom controller.
- C. Use lazy loading to load the data on demand, instead of the controller's constructor.
- D. Use an <apex:actionPoller> in the page to load all of the data asynchronously.

Suggested Answer: C

Universal Containers wants to use a Customer Community with Customer Community Plus licenses so their customers can track how many containers they are renting and when they are due back. Many of their customers are global companies with complex Account hierarchies, representing various departments within the same organization. One of the requirements is that certain community users within the same Account hierarchy be able to see several departments' containers, based on a junction object that relates the Contact to the various Account records that represent the departments.

Which solution solves these requirements?

- A. A Visualforce page that uses a Custom Controller that specifies without sharing to expose the records
- B. A Custom List View on the junction object with filters that will show the proper records based on owner
- C. A Custom Report Type and a report Lightning Component on the Community Home Page
- D. An Apex Trigger that creates Apex Managed Sharing records based on the junction object's relationships

Suggested Answer: C

upvoted 2 times

🗨️ **Paruv** Most Recent 6 months, 1 week ago

Ans: D
upvoted 1 times

🗨️ **Debugs_Bunny** 1 year, 1 month ago

Selected Answer: D

C. A Custom Report Type and a report Lightning Component on the Community Home Page: This would provide a way for users to see data they have access to, but like Custom List Views, reporting respects the organization's sharing model. Reports alone cannot grant additional access beyond what the user already has.

D. An Apex Trigger that creates Apex Managed Sharing records based on the junction object's relationships: This approach uses Apex Managed Sharing to programmatically share records with users based on complex sharing requirements that cannot be met with standard sharing functionality. Apex Managed Sharing is specifically designed to handle scenarios where sharing needs to go beyond the typical role hierarchy or sharing rules.

A company has a Lightning Page with many Lightning Components, some that cache reference data. It is reported that the page does not always show the most current reference data.

What can a developer use to analyze and diagnose the problem in the Lightning Page?

- A. Salesforce Lightning Inspector Actions Tab
- B. Salesforce Lightning Inspector Event Log Tab
- C. Salesforce Lightning Inspector Transactions Tab
- D. Salesforce Lightning Inspector Storage Tab

Suggested Answer: *D*

  **Bruce888** 3 months, 2 weeks ago

I chose the D answer.

Actions Tab

This tab shows the server-side actions executed. The list automatically refreshes when the page updates.

Transactions Tab

Some apps delivered by Salesforce include transaction markers that enable you to see fine-grained metrics for actions within those transactions.

Event Log Tab

This tab shows all the events fired. The event graph helps you to understand the sequence of events and handlers for one or more actions.

Storage Tab

This tab shows the client-side storage for Lightning applications. Actions marked as storable are stored in the actions store. Use this tab to analyze storage in the Salesforce mobile app and Lightning Experience.

  **Sappaul** 2 years ago

D is right answer

upvoted 3 times

A company has code to update a Request and Request Lines and make a callout to their external ERP system's REST endpoint with the updated records.

```
public void updateAndMakeCallout(Map<Id, Request__c> reqs, Map<Id, Request_Line__c> reqLines) {
    Savepoint sp = Database.setSavepoint ();

    try {
        insert reqs.values();
        insert reqLines.values();
        HttpResponse response = CalloutUtil.makeRestCallout (reqs.keySet(), reqLines.keySet());
    } catch (Exception e) {
        Database.rollback (sp);
        System.debug (e);
    }
}
```

The CalloutUtil.makeRestCallout fails with a 'You have uncommitted work pending. Please commit or rollback before calling out' error. What should be done to address the problem?

- A. Remove the Database.setSavepoint and Database.rollback.
- B. Change the CalloutUtil.makeRestCallout to an @InvocableMethod method.
- C. Change the CalloutUtil.makeRestCallout to an @future method.
- D. Move the CalloutUtil.makeRestCallout method call below the catch block.

Suggested Answer: C

Community vote distribution

C (86%)

14%

 **rufusroffie** Highly Voted 1 year, 4 months ago

Selected Answer: C

B is definitely incorrect because InvocableMethod can only take a list of primitive data type/subject type/generic subject type/variables, in conclusion, the input parameter is always a LIST;

C is correct because map.keySet() returns a set of key in this case a set of Id, which is not even subject.

-Methods with the future annotation must be static methods, and can only return a void type. The specified parameters must be primitive data types, arrays of primitive data types, or collections of primitive data types. Methods with the future annotation can't take sObjects or objects as arguments

A literally does nothing here, and D is obviously wrong lmao

upvoted 7 times

C is correct

upvoted 1 times

 **levian** 9 months, 1 week ago

C is correct

upvoted 1 times

 **doggs119** 1 year, 6 months ago

This is actually correct.

A component that provides support for invoking controller action methods directly from JavaScript code using an AJAX request. An <apex:actionFunction> component must be a child of an <apex:form> component.

Unlike <apex:actionSupport>, which only provides support for invoking controller action methods from other Visualforce components, <apex:actionFunction> defines a new JavaScript function which can then be called from within a block of JavaScript code.

Also

A component that adds AJAX support to another component, allowing the component to be refreshed asynchronously by the server when a particular event occurs, such as a button click or mouseover.

Use this component to get user input for a controller method that does not correspond to a field on an sObject. Only <apex:inputfield> and <apex:outfield> can be used with sObject fields.

In this instance, it does correspond to a subject so B is correct

upvoted 3 times

  **NPW89** 1 year, 7 months ago

apex:actionSupport

A component that adds AJAX support to another component, allowing the component to be refreshed asynchronously by the server when a particular event occurs, such as a button click or mouseover.

upvoted 2 times

```

@isTest
static void testAccountUpdate() {
    Account acct = new Account(Name = 'Test');
    acct.Integration_Updated__c = false;
    insert acct;

    CalloutUtil.sendAccountUpdate(acct.Id);

    Account acctAfter = [SELECT Id, Integration_Updated__c FROM Account WHERE Id = :acct.Id][0];
    System.assert(true, acctAfter.Integration_Updated__c);
}

```

The test method above calls a web service that updates an external system with Account information and sets the Account's Integration_Updated__c checkbox to

True when it completes. The test fails to execute and exits with an error: "Methods defined as TestMethod do not support Web service callouts."

What is the optimal way to fix this?

- A. Add Test.startTest() before and Test.setMock and Test.stopTest() after CalloutUtil.sendAccountUpdate.
- B. Add Test.startTest() and Test.setMock before and Test.stopTest() after CalloutUtil.sendAccountUpdate.
- C. Add if (!Test.isRunningTest()) around CalloutUtil.sendAccountUpdate.
- D. Add Test.startTest() before and Test.stopTest() after CalloutUtil.sendAccountUpdate.

<https://developer.salesforce.com/docs/component-library/bundle/lightning:layoutItem/example#lightningcomponentdemo:exampleLayoutItemsSizeOverrides>
upvoted 17 times

 **Santosh_1981** Most Recent 1 month, 1 week ago

Answer is A.

The lightning:layoutItem components are assigned sizes based on device sizes (medium and large) to control the layout behavior on different screen sizes.

In option A, the sizes are set to "6" for mediumDeviceSize, indicating that each layout item should take up half the width on medium devices (like tablets) and "4" for largeDeviceSize, indicating that each layout item should take up one-third of the width on large devices (like desktops).

This configuration allows the information to display correctly on desktops and tablets in a single row, with each item taking up the appropriate width based on the screen size.

C is the correct

upvoted 1 times

 **MetaLojiqTee** 5 months, 1 week ago

Selected Answer: C

Each component will take up all 12/12 columns of a row on small devices, but for medium and larger devices each component will take up 4/12 columns of the row and hence all 3 components will appear in one row

upvoted 1 times

🗨️ 👤 **salesforceNagibator93** 9 months ago

<https://developer.salesforce.com/docs/component-library/bundle/lightning:layoutItem/documentation> - If you specify the size and smallDeviceSize attributes, the size attribute applies to small mobile phones, and the smallDeviceSize applies to smart phones. The sizing attributes are additive and apply to devices of the specified size and larger. For example, if you set mediumDeviceSize=10 and don't set largeDeviceSize, then mediumDeviceSize applies to tablets, desktops, and larger devices. You'd also have to set size to apply to devices smaller than tablets.

A company processes Orders within their Salesforce instance. When an Order's status changes to 'Paid' it must notify the company's order management system (OMS). The OMS exposes SOAP web service endpoints to listen for when to retrieve the data from Salesforce. What is the optimal method to implement this?

- A. Generate the Enterprise WSDL and use it to make a callout to the OMS.
- B. Generate the Partner WSDL and use it to make a callout to the OMS.
- C. Create an Outbound Message that contains the session ID and send it to the OMS.
- D. Create an Apex trigger and make a callout to the OMS from the trigger.

Suggested Answer: C

Community vote distribution

Hello_Sfdc Highly Voted 3 years, 10 months ago

Is it C by using WF outbound?

upvoted 6 times

AntoineX Most Recent 1 month, 2 weeks ago

D.

Real-time Notification: An Apex trigger on the Order object can fire automatically when an Order's status changes to 'Paid'. This ensures that the OMS is notified in real-time, without any delays.

upvoted 1 times

FriedConsole2000 11 months ago

Selected Answer: C

Must be outbound message as Salesforce wants people to use those.

upvoted 1 times

Prabu_Kumarasaamy 1 year, 6 months ago

Selected Answer: D

Option C (using an Outbound Message) is a viable alternative, but it has some limitations. Outbound Messages are SOAP-based and can be configured to automatically trigger a callout when a record meets specific criteria. However, they are less flexible and require additional configuration steps compared to the direct callout approach with Apex triggers.

Therefore, option D is the recommended approach for implementing the integration with the OMS when an Order's status changes to 'Paid'.

Selected Answer: A

"Prior to API version 44.0, to cache data returned from an Apex method, you had to call `setStorable()` in JavaScript code on every action that called the Apex method. For API version of 44.0 or higher, you must mark the Apex method as storable (cacheable) and you can get rid of any `setStorable()` calls in JavaScript code. The Apex annotation approach is better because it centralizes your caching notation for a method in the Apex class."

Option A

Ans: A

To improve runtime performance, set `@AuraEnabled(cacheable=true)` to cache the method results on the client.

upvoted 5 times

A developer is asked to update data in an org based on new business rules. The new rules state that Accounts with the type set to 'Customer' should have a status of 'Active', and Accounts with the type set to 'Prospect' should have a status of 'Pending'. No other changes to data should be made.

Which code block will accurately meet the business requirements?

- A. `Map<String, String> statusMap = new Map<String, String>{'Customer'=>'Active', 'Prospect'=>'Pending'} List<Account> accountUpdates = new List<Account>(); for (Account a : [SELECT Id, Type FROM Account]){ if (statusMap.containsKey(a.Type)) { a.Status = a.Type == 'Customer' ? 'Active' : 'Pending'; } accountUpdates.add(a); } update accountUpdates;`
- B. `Map<String, String> statusMap = new Map<String, String>{'Customer'=>'Active', 'Prospect'=>'Pending'} List<Account> accountUpdates = new List<Account>(); for (Account a : [SELECT Id, Type FROM Account WHERE Status IN :statusMap.keySet()]){ a.Status = statusMap.get(a.Type); accountUpdates.add(a); } update accountUpdates;`
- C. `List<Account> accountUpdates = new List<Account>(); for (Account a : [SELECT Id, Type FROM Account]){ if (String.isNotBlank(a.Type) && a.Type == 'Customer'){ a.Status = 'Active'; } if (String.isNotBlank(a.Type) && a.Type == 'Prospect'){ a.Status = 'Pending'; } accountUpdates.add(a); } update accountUpdates;`
- D. `List<Account> accountUpdates = new List<Account>(); for (Account a : [SELECT Id, Type FROM Account]){ a.Status = a.Type == 'Customer' ? 'Active' : 'Pending'; accountUpdates.add(a); } update accountUpdates;`

Suggested Answer: A

 **kushalbakshi** Highly Voted 3 years, 11 months ago

This should be 'C'. D option will update all the Account records instead of only the required ones.
upvoted 11 times

 **KAALISHAN** Highly Voted 1 year, 8 months ago

Selected Answer: B

B seems to be the right answer. It has the status in the query, and does the update as required. Not sure why no one is considering B and not saying why it's wrong either!
upvoted 5 times

 **Sri0507** 1 year ago

B is not correct because in the query, filter is Status and it should be Type not Status. So it will never enter into for loop.
upvoted 1 times

 **AntoineX** Most Recent 1 month, 2 weeks ago

Answer is B
upvoted 1 times

 **beardAnt** 3 months, 1 week ago

I tested the A solution and it works correctly
upvoted 1 times

 **corpex** 7 months, 3 weeks ago

Selected Answer: A

- A. Is correct and more optimized. With `.containsKey` null values are avoided.
- B. Is wrong because the soql is filtering by Status instead of Type, It wont receive any result
- C. Is correct but it less maintainable and less flexible. Mapping is a better choice.
- D. Is wrong because it will update all accounts with null types to Pending.

In my opinion the option B was badly written in examtopics and the original exam had the soql filtering by Type which would make it perfect in terms of optimization, but in this context, A should be the correct answer.

Write answer is C, A and D can changing Accounts with other Types and B will give you not correct data because of wrong SQL

upvoted 1 times

🗨️ **code_breaker_27** 1 year, 3 months ago

Since the question mentioned "No other changes to data should be made", ALL answers are wrong. Query should filter Account Type IN ('Customer', 'Prospect') or should filter result if Type == Customer or Type == Prospect and only add them to the list to be updated.

upvoted 1 times

🗨️ **karappo** 1 year, 10 months ago

Should be C.

A will also update account with type = null or empty

upvoted 1 times

🗨️ **amilaveer** 2 years ago

All the answers are incorrect because "Status " is not in SQL.

Other than that "B" is the correct answer

upvoted 2 times

🗨️ **agjksjrhgksf** 2 years, 7 months ago

Selected Answer: A

Only A does it all. C doesn't do second half of the task.

upvoted 4 times

🗨️ **suddeb** 2 years, 9 months ago

Answer D cannot be right. This solution will fail at the 3rd line, because you would set the 'Pending' status for every other type than customer. Also e.g. for 'Agency'. This means for type 'Customer' you would set the status 'Active' correctly, but for EVERY other type (Prospect, but ALSO other types) you would set the status to 'Pending'.

Answer B can't be right as well, because the WHERE clause is filtering for "Status" IN the map's keySet, means it checks for a status with values "Customer" or "Prospect" (which are the Account's Type values). Therefore it will not return any account records to iterate over.

C looks to me the correct answer

upvoted 3 times

🗨️ **parishk** 2 years, 11 months ago

Its option B as the Account SQL query filter only the required fields

upvoted 1 times

🗨️ **JasonZhao** 2 years, 11 months ago

This should be A. Option C will increase the APEX CPU Time more than A.

upvoted 1 times

🗨️ **skipper009** 2 years, 11 months ago

Does anyone notice that status wasn't included in any of the SELECT? Update on any of the choices should not work.

upvoted 1 times

🗨️ **NPW89** 3 years, 1 month ago

A can be correct if where condition as follows.

```
SELECT Id, Type FROM Account WHERE Type IN :statusMap.keySet()
```

answer is C

What is a benefit of JavaScript remoting over Visualforce Remote Objects?

- A. Allows for specified re-render targets
- B. Does not require any Apex code
- C. Does not require any JavaScript code
- D. Supports complex server-side application logic

Suggested Answer: D

Community vote distribution

D (100%)

🗨️ **sajjankrgupta** Highly Voted 3 years, 6 months ago

Ans is D.

upvoted 24 times

🗨️ **Soliton321** Highly Voted 3 years, 5 months ago

D is correct. Either remote object or @remoteAction requires a JS callback, promise, async&await function to parse the JSON result from back-End to client side. For example, you can easily construct a wrapper class using @remoteAction in Apex where information from multiple queries or proxy variables can be brought together. For remote object you will need JS to do "promise.all" in order to cover that kind of wrapper in Apex, which will be very complex and hard to read

Visualforce Remote Objects:

Makes basic "CRUD" object access easy

Doesn't require any Apex code

Supports minimal server-side application logic

Doesn't provide automatic relationship traversals; you must look up related objects yourself

JavaScript Remoting:

Requires both JavaScript and Apex code

Supports complex server-side application logic

Handles complex object relationships better

Uses network connections (even) more efficiently

Recently a Salesforce org's integration failed because it exceeded the number of allowed API calls in a 24-hour period. The integration handles a near real-time, complex insertion of data into Salesforce.

The flow of data is as follows:

- ⇒ The integration looks up Contact records with a given email address and, if found, the integration adds a Task to the first matching Contact it finds.
- ⇒ If a match is not found, the integration looks up Lead records with a given email address and, if found, the integration adds a Task to the first matching Lead it finds.
- ⇒ If a match is not found, the integration will create a Lead and a Task for that newly created Lead.

What is one way in which the integration can stay near real-time, but not exceed the number of allowed API calls in a 24-hour period?

- A. Use the REST API as well as the SOAP API to effectively double the API calls allowed in a 24-hour period.
- B. Create an Inbound Message that, using Flow, can do all of the logic the integration code was doing.
- C. Write a custom Apex web service that, given an email address, does all of the logic the integration code was doing.
- D. Create several Apex InboundEmailHandlers to accept calls from the third-party system, thus bypassing the API limits.

Suggested Answer: C

The correct ans is C
upvoted 1 times

An environment has two Apex Triggers: an after-update trigger on Account and an after-update trigger on Contact. The Account after-update trigger fires whenever an Account's address is updated, and it updates every associated Contact with that address. The Contact after-update trigger fires on every edit, and it updates every Campaign Member record related to the Contact with the Contact's state.

Consider the following: A mass update of 200 Account records' addresses, where each Account has 50 Contacts. Each Contact has 1 Campaign Member. This means there are 10,000 Contact records across the Accounts and 10,000 Campaign Member records across the contacts.

What will happen when the mass update occurs?

- A. The mass update will fail, since the two triggers fire in the same context, thus exceeding the number of records processed by DML statements.
- B. There will be no error, since each trigger fires within its own context and each trigger does not exceed the limit of the number of records processed by DML statements.
- C. There will be no error, since the limit on the number of records processed by DML statements is 50,000.
- D. The mass update of Account address will succeed, but the Contact address updates will fail due to exceeding number of records processed by DML statements.

Suggested Answer: A

Correct Ans A & D

upvoted 3 times

🗳️ 👤 **moitam** 1 year, 4 months ago

According to the documentation:

https://developer.salesforce.com/docs/atlas.en-us.lightning.meta/lightning/controllers_server_apex_returning_data.htm

Results data from an Apex server-side controller must be serializable into JSON format. This means that only basic data types and sObjects are supported as return types for Apex controllers called by Lightning Aura Components. Lists of custom Apex classes can also be returned, but only the values of public instance properties and methods annotated with @AuraEnabled are serialized and returned.

In this case, the correct answers are A and D

Selected Answer: AC

Return data types can be any of the following.

Simple—String, Integer, and so on. See Basic Types for details.

sObject—standard and custom sObjects are both supported. See Standard and Custom Object Types.

Apex—an instance of an Apex class. (Most often a custom class.) See Custom Apex Class Types. You can't use an Apex inner class as a return value for an Apex method that's called by an Aura component.

Collection—a collection of any of the other types. See Collection Types.

Add the force:lightningQuickAction interface to a Lightning component to allow it to be used as a custom action in Lightning Experience or the Salesforce - correct Answer : A
upvoted 3 times

 **amerbearat** 3 years, 4 months ago

Answer: To display a lightning component as a Quick action to an object, It must be implemented with force:lightningQuickAction OR force:lightningQuickActionWithoutHeader.

upvoted 3 times

Sometimes events on Salesforce need to be handled by an external system due to the scale or type of process being executed. Consider the use case of a user in

Salesforce needing to get pricing for an order they are building in Salesforce while on the phone with a customer.

The pricing logic already exists in a third-party system. Instead of recreating this logic in Salesforce, it will be leveraged by making a request of the third-party system. The response, in this case the pricing, will be returned and stored back in Salesforce.

What is the optimal solution?

- A. A Visualforce page that can make a real-time Apex callout to display and save the pricing back in Salesforce
- B. An Apex trigger that upon saving the Order will make a real-time Apex callout, saving the pricing back in Salesforce
- C. A Process Builder process and Outbound Message to fetch the pricing upon save and store the pricing in Salesforce
- D. An ETL tool to process batches of newly saved Orders every few minutes to store the pricing back in Salesforce

Suggested Answer: A

Which use case can only be performed by using asynchronous Apex?

- A. Scheduling a batch process to complete in the future
- B. Processing high volumes of records
- C. Updating a record after the completion of an insert
- D. Calling a web service from an Apex trigger

Correct Answer: *D*

Currently there are no comments in this discussion, be the first to comment!

```
@isTest
static void testIncrement() {
    Account acct = new Account(Name = 'Test');
    acct.Number_Of_Times_Viewed__c = 0;
    insert acct;
    AuditUtil.incrementViewed(acct.Id);
    Account acctAfter = [SELECT Number_Of_Times_Viewed__c FROM Account WHERE Id = :acct.Id][0]
    System.assertEquals(1, acctAfter.Number_Of_Times_Viewed__c);
}
```

The test method above calls an @future method that increments the Number_of_Times_Viewed__c value. The assertion is failing because the Number_of_Times_Viewed__c equals 0.

What is the optimal way to fix this?

- A. Change the initialization to acct.Number_Of_Times_Viewed__c = 1.
- B. Add Test.startTest() before and Test.stopTest() after AuditUtil.incrementViewed.
- C. Add Test.startTest() before and Test.stopTest() after insert acct.
- D. Change the assertion to System.assertEquals(0, acctAfter.Number_Of_Times_Viewed__c).

A company represents their customers as Accounts that have an External ID field called Customer_Number__c. They have a custom Order (Order__c) object, with a Lookup to Account, to represent Orders that are placed in their external order management system (OMS). When an order is fulfilled in the OMS, a REST call to Salesforce should be made that creates an Order record in Salesforce and relates it to the proper Account.

What is the optimal way to implement this?

- A. Perform a REST GET on the Account and a REST POST to update the Order__c with the Account's record ID.
- B. Perform a REST PATCH to upsert the Order__c and specify the Account's Customer_Number__c in it.
- C. Perform a REST POST to update the Order__c and specify the Account's Customer_Number__c in it.
- D. Perform a REST GET on the Account and a REST PATCH to upsert the Order__c with the Account's record ID.

Ans is D ... as it can be handled in process builder

upvoted 4 times

A company represents their customers as Accounts in Salesforce. All customers have a unique Customer_Number__c that is unique across all of the company's systems. They also have a custom Invoice__c object, with a Lookup to Account, to represent invoices that are sent out from their external system. This company wants to integrate invoice data back into Salesforce so Sales Reps can see when a customer is paying their bills on time.

What is the optimal way to implement this?

- A. Ensure Customer_Number__c is an External ID and that a custom field Invoice_Number__c is an External ID and Upsert invoice data nightly.
- B. Query the Account Object upon each call to insert invoice data to fetch the Salesforce ID corresponding to the Customer Number on the invoice.
- C. Create a cross-reference table in the custom invoicing system with the Salesforce Account ID of each Customer and insert invoice data nightly.
- D. Use Salesforce Connect and external data objects to seamlessly import the invoice data into Salesforce without custom code.

Suggested Answer: A

🗨️ **doni10** 1 month, 3 weeks ago

A looks good but no need to upsert as the invoice can't be in the external system without being in salesforce as the creation is done in salesforce. And an invoice should never be deleted
upvoted 1 times

🗨️ **Ting21** 1 year, 9 months ago

since the invoice__C object is already on salesforce so cannot be D. ans is A.
upvoted 3 times

🗨️ **thneeb** 1 year, 11 months ago

C is the correct answer. You need the Accounts Salesforce ID to fill the lookup in the Invoice__c and that can be done by a X-reference table. But A is not wrong.

A developer built a Component to be used at the front desk for guests to self-register upon arrival at a kiosk. The developer is now asked to create a Component for the Utility Tray to alert Users whenever a guest has arrived at the front desk. What should be used?

- A. Application Event
- B. DML Operation
- C. Component Event
- D. ChangeLog

Suggested Answer: C

Community vote distribution

A (50%)

C (50%)

🗨️ **MarkusT** 1 month ago

Weird question. Both application and component events only fire in the SAME browser. So, only that kiosk's components would be notified for both those events. But the problem should assume that other users are using other screens - desktop/ipad/mobile etc. and they need to be alerted about this new guest. Not just same browser, but different browser/salesforce app (mobile or whatever).

I'd say the answer is B although it's not a full answer - another component should poll it from database and then show it to users. If there was answer for Message Channel/Platform Event, that'd be a better fit as it works from database level - not just at browser level.

upvoted 1 times

🗨️ **pddumps** 5 months, 4 weeks ago

Selected Answer: A

To create a Component for the Utility Tray to alert Users whenever a guest has arrived at the front desk, the appropriate option would be:

A. Application Event

Explanation:

Application events are suitable for scenarios where multiple components across the application need to communicate with each other. In this case, when a guest self-registers at the kiosk (front desk), an application event can be fired to notify the Utility Tray component. The Utility Tray component can then handle the event and display an alert to the users.

Option C (Component Event) is used for communication between parent and child components, and it may not be the most suitable for this scenario where communication is needed across different parts of the application

upvoted 3 times

🗨️ **moitam** 10 months, 2 weeks ago

Selected Answer: C

You need to use a component event, which is a type of event that is fired from an instance of a component and can be handled by the component itself or by a parent component.

upvoted 1 times

🗨️ **MetaLojiqTee** 11 months, 1 week ago

Selected Answer: C

The two components must communicate using Component Events

An Apex Trigger creates a Contract record every time an Opportunity record is marked as Closed and Won. This trigger is working great, except (due to a recent acquisition) historical Opportunity records need to be loaded into the Salesforce instance. When a test batch of records is loaded, the Apex Trigger creates Contract records. A developer is tasked with preventing Contract records from being created when mass loading the Opportunities, but the daily users still need to have the Contract records created. What is the most extendable way to update the Apex Trigger to accomplish this?

- A. Use a Hierarchy Custom Setting to disable the Trigger for the user who does the data loading.
- B. Use a List Custom Setting to disable the Trigger for the user who does the data loading.
- C. Add the Profile Id of the user who does the data loading to the Trigger so the Trigger won't fire for this user.
- D. Add a Validation Rule to the Contract to prevent Contract creation by the user who does the data loading.

Suggested Answer: A

  **costansin** Highly Voted 4 months, 1 week ago

B: we dont need list

C: Don't hardcode ids into code

D: Might ruin related functionality

Gotta be A

upvoted 5 times

Business rules require a Contact to always be created when a new Account is created.

What can be used when developing a custom screen to ensure an Account is not created if the creation of the Contact fails?

- A. Use the Database.Delete method if the Contact insertion fails.
- B. Use the Database.Insert method with allOrNone set to False.
- C. Disable Validation rules on Contacts and set default values with a Trigger.
- D. Use setSavePoint() and rollback() with a try/catch block.

Correct Answer: *D*

Currently there are no comments in this discussion, be the first to comment!

```

trigger AssignOwnerByRegion on Account ( before insert, before update )
{
List<Account> accountList = new List<Account>();
for( Account anAccount : trigger.new )
{
Region__c theRegion = [
SELECT Id, Name, Region_Manager__c

FROM Region__c -
WHERE Name = :anAccount.Region_Name__c
];
anAccount.OwnerId = theRegion.Region_Manager__c;
accountList.add( anAccount );
}
update accountList;
}

```

Consider the above trigger intended to assign the Account to the manager of the Account's region.
Which two changes should a developer make in this trigger to adhere to best practices? (Choose two.)

- A. Use a Map to cache the results of the Region__c query by Id.
- B. Move the Region__c query to outside the loop.
- C. Remove the last line updating accountList as it is not needed.
- D. Use a Map accountMap instead of List accountList.

B) Performing Queries inside a loop is not good practice, C) Changes made to records retrieved from 'Before' trigger context are automatically persisted if the trigger transaction completes successfully
upvoted 1 times
- 🗳️ **ram12313** 1 year, 3 months ago
B&C is correct if we're only talking about best practices.
But we still need to tidy it up a bit like code below.

```

trigger AssignOwnerByRegion on Account ( before insert, before update )
{
Set<String> acctRegionNames = new Set<String>();

```

```
for( Account acc : Trigger.new){
acctRegionNames.add(acc.Region_Name__c);
}
Map<String, String> regionMap = new Map<String, String>();
for( Region__c reg : [SELECT Name, Region_Manager__c FROM Region__c Name IN :acctRegionNames]){
regionMap.put(reg.Name, reg.Region_Manager__c);
}
for( Account anAccount : trigger.new ){
if(regionMap.containsKey(anAccount.Name)){
anAccount.OwnerId = regionMap.get(anAccount.Name);
}
}
}
```

Example 1:

```
AggregateResult[] groupedResults = [SELECT CampaignId, AVG(Amount) FROM Opportunity GROUP BY CampaignId]; for (AggregateResult ar : groupedResults)
{
System.debug('Campaign ID' + ar.get('CampaignId'));
System.debug('Average amount' + ar.get('expr0'));
}
```

Example 2:

```
AggregateResult[] groupedResults = [SELECT CampaignId, AVG(Amount) theAverage FROM Opportunity GROUP BY CampaignId]; for (AggregateResult ar : groupedResults)
{
System.debug('Campaign ID' + ar.get('CampaignId'));
System.debug('Average amount' + ar.get('theAverage'));
}
```

Example 3:

```
AggregateResult[] groupedResults = [SELECT CampaignId, AVG(Amount) FROM Opportunity GROUP BY CampaignId]; for (AggregateResult ar : groupedResults)
{
System.debug('Campaign ID' + ar.get('CampaignId'));
System.debug('Average amount' + ar.get.AVG());
}
```

Example 4:

```
AggregateResult[] groupedResults = [SELECT CampaignId, AVG(Amount) theAverage FROM Opportunity GROUP BY CampaignId]; for (AggregateResult ar : groupedResults)
{
System.debug('Campaign ID' + ar.get('CampaignId'));
System.debug ('Average amount' + ar.theAverage);
}
```

Which two of the examples above have correct System.debug statements? (Choose two.)

- A. Example 1
- B. Example 2
- C. Example 3
- D. Example 4

A company has a web page that needs to get Account record information, given its Salesforce record ID, from JavaScript on the page and then display it.

Which method of integration is optimal?

- A. REST API
- B. Apex SOAP Web Service
- C. Soap API
- D. Apex REST Web Service

Suggested Answer: A

Community vote distribution

nibbio Highly Voted 3 years, 1 month ago

REST API is more than enough to get the Account information by its ID, there is no need to expose a REST WEB SERVICE from Salesforce
upvoted 11 times

gsori Most Recent 5 months ago

Selected Answer: D

I'd say D

https://trailhead.salesforce.com/content/learn/modules/apex_integration_services/apex_integration_webservices

"By making your methods callable through the web, your external applications can integrate with Salesforce to perform all sorts of nifty operations."

A web page that needs to retrieve account info from SF sounds like an external application to me,
upvoted 1 times

thneeb 1 year, 11 months ago

Selected Answer: A

A, the ootb REST API can be used
upvoted 2 times

lorenac2 2 years ago

Selected Answer: A

I said D myself, but I think the confusion comes from that cast that I thought 'Rest API' implied that Salesforce was using a callout to an external service whereas the external service is using the API (without a custom class) to get the information. The reason why it mentions Javascript is because REST supports JSON whereas SOAP does not, it only supports XML.

upvoted 3 times

amilaveer 2 years ago

Selected Answer: A

REST API is enough
upvoted 2 times

Ronin192 2 years, 1 month ago

Answer is A.

Apex REST Web Service is only used if you need to perform custom logic.
upvoted 1 times

nkarmi 2 years, 2 months ago

The correct is A you don't need to expose the apex rest service and write a test class for just retrieving an account, just call a rest API
https://developer.salesforce.com/docs/atlas.en-us.api_rest.meta/api_rest/dome_get_field_values.htm

upvoted 1 times

levian 2 years, 3 months ago

Correct is D, because its a call from web to SF. If it was a call from SF to web, it would be A

upvoted 3 times

  **OmShantiVeg** 2 years, 5 months ago

Correct is D because from the web page you need to access Sf

upvoted 3 times

A large company uses Salesforce across several departments. Each department has its own Salesforce Administrator. It was agreed that each Administrator would have their own sandbox in which to test changes.

Recently, users notice that fields that were recently added for one department suddenly disappear without warning. Also, Workflows that once sent emails and created tasks no longer do so.

Which two statements are true regarding these issues and resolution? (Choose two.)

- A. The administrators are deploying their own Change Sets, thus deleting each other's fields from the objects in production.
- B. A sandbox should be created to use as a unified testing environment instead of deploying Change Sets directly to production.
- C. Page Layouts should never be deployed via Change Sets, as this causes Workflows and Field-level Security to be reset and fields to disappear.
- D. The administrators are deploying their own Change Sets over each other, thus replacing entire Page Layouts and Workflows in Production.

Suggested Answer: BD

🗨️ **santo_aj** 2 months ago

C is the correct answer.

https://developer.salesforce.com/docs/atlas.en-us.pages.meta/pages/pages_dynamic_vf.htm

upvoted 1 times

🗨️ **cPickle** 2 months, 3 weeks ago

Selected Answer: C

C is correct.

Question asked "Apex code".

Dynamic schema binding allows developers to write Apex code that dynamically references custom or standard Salesforce objects, fields, and relationships based on user selections or dynamic criteria. In this case, the users want to pick the five fields to use as filter fields when they run the page. With dynamic schema binding, the Apex code can read the user selections and dynamically construct a query that includes the selected fields as filter criteria.

upvoted 2 times

🗨️ **thneeb** 5 months ago

Selected Answer: B

B. They use it to give the user the choice, which fields he wants to filter on. SOSL can be used as well and can be limited to one SObject, but the search cannot be adjusted to specific fields.

upvoted 1 times

🗨️ **lorenac2** 6 months, 1 week ago

I honestly would throw this question out. It would be better to use dynamic SOQL, not SOSL, because we are searching a single object. I don't see B being relevant as describeSObjects() provides a list of describe results for, generally, a list of sObjects. Again, we are only interested in one. D is irrelevant as the information is already in the org. C doesn't seem to be a thing, so unless there is a typo here and should be simplified to 'dynamic apex', then C is wrong as well.

upvoted 2 times

🗨️ 👤 **ChiaSam** 1 year ago

Selected Answer: B

B seems to be correct as requirement is to dynamically select the fields at run time, which we can achieve with describeSObjects() by fetching all fields. Option A says SOSL queries, rather than dynamic SOSL.

upvoted 1 times

🗨️ 👤 **KK13** 1 year, 6 months ago

Universal Containers uses Big Objects to store almost a billion customer transactions called Customer_Transaction__b. These are the fields on Customer_Transaction__b:

Account__c -

Program__c -

Points_Earned__c -

Location__c -

Transaction_Date__c -

The following fields have been identified as Index Fields for the Customer_Transaction__b object: Account__c, Program__c, and Transaction_Date__c.

Which SOQL query is valid on the Customer_Transaction__b Big Object?

- A. `SELECT Account__c, Program__c, Transaction_Date__c FROM Customer_Transaction__b WHERE Account__c = '001R000000302D3' AND Program__c = 'Shoppers' AND Transaction_Date__c=2019-05-31T00:00Z`
- B. `SELECT Account__c, Program__c, Transaction_Date__c FROM Customer_Transaction__b WHERE Account__c = '001R000000302D3' AND Program__c LIKE 'Shop%' AND Transaction_Date__c=2019-05-31T00:00Z`
- C. `SELECT Account__c, Program__c, Transaction_Date__c FROM Customer_Transaction__b WHERE Account__c = '001R000000302D3' AND Program__c INCLUDES ('Shoppers', 'Womens') AND Transaction_Date__c=2019-05-31T00:00Z`
- D. `SELECT Account__c, Program__c, Transaction_Date__c FROM Customer_Transaction__b WHERE Account__c = '001R000000302D3' AND Program__c EXCLUDES ('Shoppers', 'Womens') AND Transaction_Date__c=2019-05-31T00:00Z`

Suggested Answer: A

Community vote distribution

A (100%)

 **au_** Highly Voted 4 months, 2 weeks ago

Answer is A

The following SOQL operations are not allowed in queries with big objects:

The !=, LIKE, NOT IN, EXCLUDES, and INCLUDES operators aren't valid in any query. So options B,C,D are not correct.

upvoted 5 times

 **lorenac2** Most Recent 1 year ago

Selected Answer: A

I tried to find out when and how you can query non-indexed field, but couldn't get an answer. For more info:

Part of a custom Lightning Component displays the total number of Opportunities in the org, which is in the millions. The Lightning Component uses an Apex Controller to get the data it needs.

What is the optimal way for a developer to get the total number of Opportunities for the Lightning Component?

- A. Apex Batch job that counts the number of Opportunity records
- B. SUM() SOQL aggregate query on the Opportunity object
- C. SOQL for loop that counts the number of Opportunities records
- D. COUNT() SOQL aggregate query on the Opportunity object

Suggested Answer: D

Community vote distribution

nibbio Highly Voted 3 years, 1 month ago

SELECT COUNT() is the correct answer (D).

Tested with a Case object containing 7 millions of records

upvoted 11 times

rodmfpc Highly Voted 3 years, 9 months ago

Aditya97 I think D. COUNT() could be right because:

Queries that include aggregate functions are still subject to the limit on total number of query rows i.e 50,000. All aggregate functions other than COUNT() or COUNT(fieldname) include each row used by the aggregation as a query row for the purposes of limit tracking.

For COUNT() or COUNT(fieldname) queries, limits are counted as one query row, unless the query contains a GROUP BY clause, in which case one query row per grouping is consumed.

upvoted 7 times

singhkar 3 years, 7 months ago

A is the correct ans because the records are in millions not 50000

upvoted 1 times

Selected Answer: C

Count is the answer

upvoted 1 times

FriedConsole2000 11 months ago

Selected Answer: D

Count should be used in an aggregate SOQL

upvoted 1 times

santo_aj 1 year, 8 months ago

Selected Answer: D

SELECT COUNT() is the correct answer (D).

upvoted 1 times

lorenac2 2 years ago

The answer is D. Using the basic COUNT() function returns an integer, not an aggregate result, so there is even less code to write. Also, the limit is on the number of rows retrieved, not queried against.

https://developer.salesforce.com/docs/atlas.en-us.soql_sosl.meta/soql_sosl/sforce_api_calls_soql_select_count.htm

https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/langCon_apex_SOQL_agg_fns.htm

upvoted 1 times

Ans is d => https://help.salesforce.com/s/articleView?id=release-notes.rn_apex_soql_count_limits.htm&type=5&release=214
upvoted 2 times

🗨️ 👤 **Rob177** 2 years, 11 months ago

Selected Answer: A

Should be A, as COUNT() hits the limits of 50k records.

<https://metillium.com/2016/05/soql-50000-record-limit-applies-with-count/>

upvoted 1 times

🗨️ 👤 **ChiaSam** 2 years, 6 months ago

it is no more applicable as now it is treated as just 1 row being returned.

upvoted 2 times

🗨️ 👤 **Jokei** 1 year ago

Wrong information!

upvoted 2 times

🗨️ 👤 **Sri_Vathsa** 3 years, 1 month ago

D is the correct answer without any doubt. Count() only contributes as 1 SOQL query.

upvoted 2 times

🗨️ 👤 **ncore** 3 years, 1 month ago

I also think D is correct according to this source https://help.salesforce.com/s/articleView?id=release-notes.rn_apex_soql_count_limits.htm&type=5&release=214

upvoted 3 times

🗨️ 👤 **Aditya97** 3 years, 11 months ago

Correct answer should be A as there are millions of Opportunities and COUNT() will hit limit t 50000 records.

upvoted 3 times

A company notices that their unit tests in a test class with many methods to create many records for prerequisite reference data are slow. What can a developer do to address the issue?

- A. Move the prerequisite reference data setup to a `TestDataFactory` and call that from each test method.
- B. Move the prerequisite reference data setup to a `@testSetup` method in the test class.
- C. Move the prerequisite reference data setup to a static method in the test class and call that from each test method.
- D. Move the prerequisite reference data setup to the constructor for the test class.

Suggested Answer: B

The Answer is B

upvoted 16 times

  **amerbearat** Highly Voted 1 year, 10 months ago

Should be B

upvoted 7 times

  **lorenac2** Most Recent 6 months, 1 week ago

Selected Answer: B

The answer is B. Answer A just moves the logic outside of the test class, but still runs the same amount of code. When you could do is use a `TestDataFactory` class marked with `@IsTest` and put that in the `@TestSetup` method, especially if more than one test class will be using the same data.

upvoted 2 times

  **Dean5555** 9 months ago

Selected Answer: B

B as levian explained

upvoted 2 times

  **levian** 9 months, 1 week ago

Its B, because the problem is "many methods to create many records", if we use `testSetup` dont need to create many methods and the performance is increased. `TestDataFactory` is used for reuse record creation in many classes, for example, create Account, Contact records, and reuse in many classes. But the question is not asking about reuse in other classes, so `TestSetup` its enough.

upvoted 2 times

  **ChiaSam** 1 year ago

Answer is A, as question is talking about improvement in slowness, B would not make it faster although a recommended way.

upvoted 1 times

  **singhkar** 2 years, 1 month ago

The correct ans is B

upvoted 6 times

A developer is asked to build a solution that will automatically send an email to the Customer when an Opportunity stage changes. The solution must scale to allow for 10,000 emails per day. The criteria to send the email should be evaluated after all Workflow Rules have fired. What is the optimal way to accomplish this?

- A. Use a MassEmailMessage() with an Apex Trigger.
- B. Use a Workflow Email Alert.
- C. Use an Email Alert with Process Builder.
- D. Use a SingleEmailMessage() with an Apex Trigger.

Suggested Answer: C

upvoted 1 times

🗨️ **vm1406** 8 months, 1 week ago

https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_triggers_order_of_execution.htm
Executes workflow rules. If there are workflow field updates:
Updates the record again.
Runs system validations again. Custom validation rules, flows, duplicate rules, processes, and escalation rules aren't run again.
Executes before update triggers and after update triggers, regardless of the record operation (insert or update), one more time (and only one more time)
Can use A. Use a MassEmailMessage() with an Apex Trigger.
upvoted 3 times

🗨️ **hoho38** 11 months, 2 weeks ago

When record get created into Salesforce following Order of execution works:

1. System Validation Rules
2. Apex Before Triggers
3. Custom Validation Rules
4. Duplicate Rules
5. Apex After Triggers
6. Assignment Rules
7. Auto-Response Rules
8. Workflow Rules
9. Processes
10. Escalation Rules
11. Roll-Up Summary Fields

Process builder is after workflow rules
upvoted 3 times

🗨️ 👤 **KK13** 1 year, 6 months ago

Now I have doubts because Triggers run before workflow rules in Order of Execution
upvoted 1 times

🗨️ 👤 **KK13** 1 year, 6 months ago

That many emails? Should be Trigger with mass email.
upvoted 2 times

🗨️ 👤 **lorenac2** 6 months, 1 week ago

It is limited to 5000 per day. https://help.salesforce.com/s/articleView?id=sf.limitations_email_mass.htm&type=5
upvoted 1 times

🗨️ 👤 **drwebber** 1 year, 7 months ago

Should be B.

The daily limit for emails sent from workflow and approval-related email alerts is 1,000 per standard Salesforce license per organization. The overall organization limit is 2,000,000.

UC Loans is a small company with a part time Salesforce administrator. UC Loans wants to create a Loan__c record whenever an Opportunity is won.

What is the optimal solution for UC Loans to accomplish this?

- A. Process Builder
- B. Quick Action
- C. Workflow Rule
- D. Apex Trigger

Suggested Answer: A

  **costansin** 4 months, 1 week ago

Yup, old questions as usual. Process builder is deprecated now but that's gotta be the answer still.

upvoted 4 times

  **Ronin192** 7 months, 2 weeks ago

Flow is the recommended tool for declarative solution now

upvoted 3 times

  **drwebber** 1 year, 7 months ago

Should be A since PB is more progressive tool than workflow

upvoted 2 times

A developer needs to send Account records to an external system for backup purposes. The process must take a snapshot of Accounts as they are saved and then make a callout to a RESTful web service. The web service can only receive, at most, one record per call. Which feature should be used to implement these requirements?

- A. @future
- B. Queueable
- C. Process Builder
- D. Workflow

Suggested Answer: C

Community vote distribution

🗳️ **Dev_Bond_ZA** Highly Voted 1 year, 10 months ago
B

Explanation

"Takes a snapshot of accounts as they are" - this is all accounts - cannot be process builder for that reason, can not be future either, has to be queueable so you can queue each account one after the other.

upvoted 5 times

🗳️ **doni10** Most Recent 1 month, 3 weeks ago

i think it is C because if you use queueable

either you make a for loop through the account list but it is limited to 50 queueable

Or you chain the queueable but you should find a way to know which account you have processed, it means pass the list of account through each queueable and remove the one that is processed before pass it to the next queueable you risk to be limited without a querylocator system and i am not sur it is possible due to then depth of the queueable that is limited

Selected Answer: C

C is correct.

Call the invocable method from process builder and from invocable method call the @future method and write your callout logic there in @future method.

upvoted 1 times

🗳️ **cPickle** 1 year, 9 months ago

C is right. Question says "The web service can only receive, at most, one record per call.". A,B can call multiple record.

upvoted 1 times

🗳️ **thneeb** 1 year, 11 months ago

Selected Answer: A

For me it is A. You need to write APEX code even if you use Process Builder. So I would directly code a APEX trigger and an @future method. If Process Builder would be able to do direct API calls, like Flow it would be fine for me. If Flow would be a choice, then I would take Flow

upvoted 1 times

🗨️ **lorenac2** 2 years ago

Selected Answer: C

This is correct as Salesforce prefers declarative first, so although @future would be used if it was a trigger, since PB is declarative, it would use this with an @InvocableMethod instead. Today, this would be done with a flow based trigger.

upvoted 1 times

🗨️ **nibbio** 3 years, 1 month ago

Selected Answer: C

Process Builder + InvocableMethod marked with (callout=true)

upvoted 2 times

🗨️ **Santoshtpd** 3 years, 5 months ago

C should be correct ,like Call the invocable method from process builder and from invocable method call the @future method and write your callout logic there in @future method.

upvoted 2 times

🗨️ **Pradip2021** 3 years, 10 months ago

It should be A, as it will call Restful web service and it is a slow process

A developer gets an error saying 'Maximum Trigger Depth Exceeded'.

What is a possible reason to get this error message?

- A. The SOQL governor limits are being hit.
- B. A process Builder is running that sends mass emails.
- C. There are numerous DML operations in the trigger logic.
- D. A trigger is recursively invoked more than 16 times.

Suggested Answer: *D*

  **karappo** 4 months, 2 weeks ago

Check trigger governor limit per transactions

<https://help.salesforce.com/s/articleView?id=000386331&type=1>

upvoted 2 times

An org has a requirement that an Account must always have one and only one Contact listed as Primary. So selecting one Contact will de-select any others. The client wants a checkbox on the Contact called 'Is Primary' to control this feature. The client also wants to ensure that the last name of every Contact is stored entirely in uppercase characters.

What is the optimal way to implement these requirements?

- A. Write an after update trigger on Contact for the Is Primary logic and a separate before update trigger on Contact for the last name logic.
- B. Write a Validation Rule on the Contact for the Is Primary logic and a before update trigger on Contact for the last name logic.
- C. Write an after update trigger on Account for the Is Primary logic and a before update trigger on Contact for the last name logic.
- D. Write a single trigger on Contact for both after update and before update and callout to helper classes to handle each set of logic.

Suggested Answer: D

Community vote distribution

D (100%)

peixotmarc 3 months, 2 weeks ago

Selected Answer: D

For me it is D. C does not make sense for me, because how you will control is Primary when you will be adding a new contact if the trigger is in Account? Also, for me, the best solution is a trigger in Contact for Is Primary and a validation rule for the LastName

Order of execution diagram: https://architect.salesforce.com/fundamentals/architecture-basics#Database_Manipulation

upvoted 1 times

A developer has been asked to create code that will meet the following requirements:

Receives input of: Map<Id, Project_c>, List<Account>

Performs a potentially long-running callout to an outside web service

Provides a way to confirm that the process executed successfully

Which asynchronous feature should be used?

- A. @future (callout=true)
- B. Database.AllowCallouts interface
- C. Schedulable interface
- D. Queueable interface

Suggested Answer: D

Community vote distribution

D (100%)

 **Liquid** Highly Voted 1 year, 9 months ago

1. Queueable Jobs can contain the member variable as SObjects or custom Apex Types.
2. When using queueable jobs it will make the AsyncApexJob which we can monitor like Scheduled jobs.
3. Queueable Apex can be called from the future and batch class.
4. Using Queueable Apex will chain up to queueable jobs and in Developer Edition it is only 5 Jobs.
upvoted 5 times

 **lorenac2** Most Recent 6 months, 1 week ago

Selected Answer: D

So ignoring the part that B is spelled wrong, D is needed for several reasons, most already mentioned. There is a second part to this though that allows for the queueable process to be reviewed, and this is generally handled with a transaction finalizer.

Trailhead: https://trailhead.salesforce.com/content/learn/modules/asynchronous_apex/async_apex_queueable

Finalizers: https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_transaction_finalizers.htm

upvoted 2 times

 **drwebber** 1 year, 7 months ago

A developer must create a custom pagination solution for accessing approximately 2000 records and displaying 50 records on each page. Data from Salesforce will be accessed via an API and not via Apex. How can the developer meet these requirements? (Choose two.)

- A. Use a StandardSetController
- B. Use CURSOR 50 in SOQL queries
- C. Use OFFSET in SOQL queries
- D. Use LIMIT 50 in SOQL queries

Suggested Answer: CD

Community vote distribution

CD (100%)

 **lorenac2** 6 months, 1 week ago

Selected Answer: CD

I would approach it this way. Assume you are querying a different Salesforce org using an API instead of querying directly such as in this example. <https://eshopsync.com/how-to-fetch-records-through-rest-api-in-apex-class-salesforce/>.

That said, the query would be built the same way. So here are the references.

Offset: https://developer.salesforce.com/docs/atlas.en-us.soql_sosl.meta/soql_sosl/sforce_api_calls_soql_select_offset.htm

Rest API Query: https://developer.salesforce.com/docs/atlas.en-us.api_rest.meta/api_rest/using_resources_working_with_searches_and_queries.htm
upvoted 3 times

A developer must create a way for external partners to submit millions of leads into Salesforce per day. How should the developer meet this requirement?

- A. Publicly expose a Visualforce page via Force.com Sites
- B. Create a web service on Heroku that uses Heroku Connect
- C. Host a Web-to-Lead form on the company website
- D. Publicly expose an Apex Web Service via Force.com Sites

Suggested Answer: B

🗨️ 👤 **lorenac2** 6 months, 1 week ago

A and C are out as these are UI based systems and require input from a user. D is viable and can run automatically in the background, although it would be better to have it using authentication. I can't answer is B is correct or not.

<https://developer.salesforce.com/blogs/developer-relations/2012/02/quick-tip-public-restful-web-services-on-force-com-sites>
upvoted 1 times

🗨️ 👤 **lorenac2** 6 months, 1 week ago

It's possible that B is definitely correct: "The most common use case with Heroku and Salesforce is to provide a high-throughput, low-latency interface for customer-facing applications built with open-source technologies."

Source: https://trailhead.salesforce.com/content/learn/modules/salesforce_heroku_integration/getting_started_with_integration

In 2023, it's more likely it will ask about Mulesoft than Heroku, or at least equal to.

upvoted 1 times

🗨️ 👤 **drwebber** 1 year, 7 months ago

Is it A?

C isn't a correct answer due to the limit of 500 leads per day

upvoted 1 times

  **gcai** 1 year, 4 months ago

Lightning Process=Process builder. Just another name.

upvoted 1 times

A company requires an external system to be notified whenever an account is updated. trigger AccountTrigger on Account (after update){ for (Account updatedAccount:Trigger.new) { AccountTriggerHelper.notinyxternalSystem(updatedAccount.id); } } public class AccountTriggerHelperfuture(callout=true) { public static void notinyxternalSystem(Id accountId){ Account acc = [Select id, name from Account where accountId = :accountId]; http objectHttp h = new Http(); HttpRequest req = new HttpRequest(); req.setEndpoint('http://example.org/ restService'); req.setMethod('POST'); req.setBody(JSON.serialize(acc)); HttpResponse res = h.send(req); } }

What LimitException could the following code trigger?

- A. System.LimitException: Too many future calls
- B. System.LimitException: Too many callouts
- C. System.LimitException: Too many SOQL queries
- D. System.CalloutException: Callout from triggers are currently not supported

Suggested Answer: D

Community vote distribution

thekumarakshay 6 months, 1 week ago

D is not of type limit exception. Hence, A.
upvoted 1 times

santo_aj 1 year, 1 month ago

Selected Answer: D

D is the correct answer because notinyxternalSystem is not marked as @future. So it was fun pulling this apart to be able to read it. Yes, it is written incorrectly. The 'callout=true' is on the wrong line is missing @future. I filled in the gap knowing the intention. So let's look at the governor limits and see what hits first.

SOQL Query: 100 per transaction

Callouts: 100 per transaction

@future: 50 per transaction

The too many future callouts hits first, hence A. THAT is what this question is asking about. In reality, as is, I don't believe the code will even compile.

Reference: https://developer.salesforce.com/docs/atlas.en-us.salesforce_app_limits_cheatsheet.meta/salesforce_app_limits_cheatsheet/salesforce_app_limits_platform_apexgov.htm

upvoted 1 times

Segre 1 year, 3 months ago

Selected Answer: A

if the syntax for annotation is fixed to @future(callout=true) then the answer is A
- SOQL is used in future so it's a different transaction with a separate 200 limit
- 100 callouts again from single transaction, not an issue
and the winner is future invocation , which could be only 50
upvoted 1 times

lorenac2 1 year, 6 months ago

A developer is using a third-party JavaScript library to create a custom user interface in Visualforce. The developer needs to use JavaScript to get data from a controller method in response to a user action.

How can the developer accomplish this?

- A. Use `<apex:actionFunction>` to create a JavaScript wrapper for the controller method
- B. Use the `@RemoteAction` annotation on the method definition with JavaScript Remoting
- C. Use the `$Controller` global variable to access the controller method via JavaScript
- D. Use `<apex:actionSupport>` to enable JavaScript support for the controller method

Suggested Answer: B

Community vote distribution

D (100%)

🗉 **ajithk47** 4 months, 2 weeks ago

Answer B Javascript remoting is correct as actionSupport does not provide javascript support. It calls the controller method directly for the selected user action.

upvoted 2 times

🗉 **GGJJ** 4 months, 4 weeks ago

Selected Answer: D

it should be D as involves a user action

upvoted 1 times

What is a consideration when using bind variables with dynamic SOQL? (Choose two.)

- A. Dynamic SOQL cannot reference fields on bind variables
- B. Dynamic SOQL cannot use bind variables
- C. Bind variables must be public or global
- D. Bind variables must be in local scope

Suggested Answer: AD

Community vote distribution

AD (75%)

AB (25%)

 **code_breaker_27** 3 months, 2 weeks ago

Selected Answer: AD

https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_dynamic_soql.htm

Bind variable used in database.query makes use of :variablename format

Needs to be local as seen in the example given.

upvoted 2 times

 **iValRV** 8 months, 2 weeks ago

Selected Answer: AD

A and D is correct:

"You can use simple bind variables in dynamic SOQL query strings when using Database.query"

https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_dynamic_soql.htm

upvoted 1 times

 **Dev_Bond_ZA** 10 months, 4 weeks ago

A and D is correct.

1. You can use simple bind variables in dynamic SOQL query strings when using Database.query'
2. However, unlike inline SOQL, you can't use bind variable fields in the query string with Database.query

https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_dynamic_soql.htm

upvoted 1 times

 **Dev_Bond_ZA** 10 months, 4 weeks ago

Also, D - local scope, is obviously correct because you will get an error otherwise.

upvoted 1 times

 **thneeb** 11 months ago

Selected Answer: AB

The referenced document of lorenac2 says that A and B is correct

upvoted 1 times

 **lorenac2** 1 year ago

For answers A/B: https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_dynamic_soql.htm

For C/D: I don't have a reference, but as seen, the variables used in the example are not public or global but they do reside in the same class, hence, local. I can't find a better definition for 'local'.

upvoted 1 times

A developer created a custom component to display an HTML table. The developer wants to be able to use the component on different Visualforce Pages and specify different header text for the table.
Which tag should the developer use inside the component?

How can the DISTANCE and GEOLOCATION functions be used in SOQL queries? (Choose two.)

- A. To filter results based on distance from a latitude and longitude
- B. To get the distance results from a latitude and longitude
- C. To order results by distance from a latitude or longitude
- D. To group results in distance ranges from a latitude and longitude

Suggested Answer: AC

Community vote distribution

AC (67%)

AB (33%)

 **rodmpwc** Highly Voted 3 years, 11 months ago

Explanation:

DISTANCE and GEOLOCATION can be used to filter and order.

Ex:

```
String queryString =
'SELECT Name, Email__c ' +
'FROM Account ' +
'WHERE DISTANCE(BillingAddress, GEOLOCATION('+lat+',+lon+), \'mi\') < 20 ' +
'ORDER BY DISTANCE(BillingAddress, GEOLOCATION('+lat+',+lon+), \'mi\') ' +
'LIMIT 10';
```

```
List<Account> accList =Database.query(queryString);
```

upvoted 7 times

 **beardAnt** Most Recent 3 months ago

Selected Answer: AC

Filter and order

upvoted 1 times

 **moitam** 1 year, 4 months ago

Selected Answer: AB

Option C is not correct because it says "To order results by distance from a latitude or longitude". This implies that you can order results by distance from either a latitude or a longitude, but not both. However, the DISTANCE function requires both a latitude and a longitude to calculate the distance from a location. Therefore, you cannot order results by distance from a latitude or longitude, but only from a latitude and longitude pair.

upvoted 2 times

 **code_breaker_27** 1 year, 3 months ago

Just to add, I think you can only get the location but not the distance this way.

```
SELECT Name, Location__latitude__s, Location__longitude__s
FROM Warehouse__c
```

CDE (100%)

🗨️ **lorenac2** 6 months ago

Selected Answer: CDE

Tooling: https://developer.salesforce.com/docs/atlas.en-us.api_tooling.meta/api_tooling/intro_rest_resource_examples.htm#topic-title

SOAP: https://developer.salesforce.com/docs/atlas.en-us.240.0.api.meta/api/sforce_api_calls_runtests.htm

Metadata: https://developer.salesforce.com/docs/atlas.en-us.api_meta.meta/api_meta/meta_deploy_run_specific_tests.htm
upvoted 1 times

🗨️ **Liquid** 1 year, 10 months ago

For Metadata API, you can run tests asynchronously using `ApexTestQueueItem` and `ApexTestResult`.
upvoted 2 times

🗨️ **amilaveer** 6 months, 2 weeks ago

How does that relate to Metadata API ?
upvoted 1 times

🗨️ **Liquid** 1 year, 10 months ago

Found the below two points in the Apex Developer Guide (https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_testing_unit_tests_running.htm):

1. You can use the `runTests()` call from the SOAP API to run tests synchronously.
2. You can also run tests using the Tooling REST API. Use the `/runTestsAsynchronous/` and `/runTestsSynchronous/` endpoints to run tests asynchronously or synchronously.

So the answer to the question should be Tooling API, SOAP API and Metadata API, because Streaming API is about events and notifications, and there is no such thing as Test API.

upvoted 3 times

Which statement is true about using ConnectApi namespace (also called Chatter in Apex)? (Choose two.)

- A. Chatter in Apex methods honor the 'with sharing' and 'without sharing' keywords
- B. Chatter in Apex operations are synchronous, and they occur immediately
- C. Chatter in Apex methods do not run in system mode; they run in the context of the current user
- D. Many test methods related to Chatter in Apex require the IsTest (SeeAllData=true) annotation

A developer receives a `LimitException: Too many query rows: 50001` error when running code.

What debugging approach using the Developer Console provides the fastest and most accurate mechanism to identify a specific component that may be returning an unexpected number of rows?

- A. Count the number of Row Limit warning messages in the Debug Logs
- B. Add `System.debug(System.getQueryRows())` to the code to track SOQL usage
- C. Filter the Debug Log on `SOQL_EXECUTE_END` statements to track the results of each SOQL Query
- D. Use the Execution Overview to see the number of rows returned by each Executed Unit

Suggested Answer: C

Community vote distribution

D (50%)

C (50%)

🗨️ **beardAnt** 3 months, 1 week ago

Selected Answer: D

the Execution Overview actually provides the exact query, filter by `SOQL_EXECUTE_END` just gives you the number of rows, but not the query itself, that is in `SOQL_EXECUTE_BEGIN` Event

upvoted 1 times

🗨️ **FriedConsole2000** 11 months ago

Selected Answer: C

"C". You want to find the SOQL that is causing the problem so you have to look at each SOQL and see they number it returns.

upvoted 1 times

🗨️ **Segre** 1 year, 9 months ago

Selected Answer: D

Definitely D, the limit is cumulative across all the SOQL queries in the transaction. So jumping from each SOQL invocation from the raw log view could take a while till you understand the whole picture which led to 50000+ records being queried.

upvoted 1 times

🗨️ **ejh** 1 year, 10 months ago

Selected Answer: D

D is better as the number of Rows is displayed in the limits tab of the Execution Overview

upvoted 1 times

🗨️ **lorenac2** 2 years ago

Selected Answer: C

If the question was slightly altered to say specific 'query' instead of 'component', then yes I believe C is correct. `SOQL_EXECUTE_END` > "Line number, number of rows, and duration in milliseconds"

https://developer.salesforce.com/docs/atlas.en-us.apexcode.meta/apexcode/apex_debugging_system_log_console.htm

upvoted 2 times

🗨️ **Peter808** 2 years, 3 months ago

I have some doubts how to consider this D because:

An execution unit is equivalent to a transaction. It contains everything that occurred within the transaction. `EXECUTION_STARTED` and `EXECUTION_FINISHED` delimit an execution unit.

Maybe the most accurate still C?

upvoted 1 times

🗨️ **nibbio** 3 years, 1 month ago

Use the Limit Panel of Execution Overview

upvoted 2 times

🗨️ **OmShantiVeg** 2 years, 5 months ago

Yes maybe D is better

upvoted 1 times

A developer is writing a Visualforce page to display a list of all of the checkbox fields found on a custom object. What is the recommended mechanism the developer should use to accomplish this?

- A. Schema Class
- B. Apex API
- C. Schema Builder
- D. Metadata API

Suggested Answer: A

Community vote distribution

A (100%)

 **lorenac2** 6 months ago

Selected Answer: A

Technically, it's the Schema namespace.

Get all fields by using getMap: https://developer.salesforce.com/docs/atlas.en-us.240.0.apexcode.meta/apexcode/apex_dynamic_field_tokens.htm

What is a recommended practice with regard to the Apex CPU limit? (Choose two.)

- A. Optimize SOQL query performance
- B. Use Map collections to cache sObjects
- C. Avoid nested Apex iterations
- D. Reduce view state in Visualforce pages

Suggested Answer: BC

Community vote distribution

BC (50%)

AC (50%)

 **drwebber** Highly Voted 3 years ago

What's not counted:

Database operations, e.g. the portion of execution time spent in the database for DML, SOQL, and SOSL isn't counted, nor is waiting time for Apex callouts., SOQL

<https://help.salesforce.com/s/articleView?id=000339361&type=1>

upvoted 8 times

 **Avinash_14** Most Recent 2 months, 4 weeks ago

A and C Optimizing SOQL query performance and avoiding nested iterations are directly related to reducing CPU usage in Apex, making A and C the best practices for managing the Apex CPU limit.

Using Map collections helps with memory efficiency and reduces the number of SOQL queries or DML operations, but it doesn't directly affect the CPU limit. It's more about avoiding the SOQL query limit or improving data access performance.

A developer has built a multi-page wizard using a single Custom Controller to query and update data. Users are complaining that the pages are loading slowly.

What will improve performance? (Choose three.)

- A. Reducing the view state
- B. Using actionRegion and rerender
- C. Turning off the standard stylesheet
- D. Setting the Apex Page attribute cache=true
- E. Using selective queries

Suggested Answer: ADE

Community vote distribution

ABE (67%)

ACE (33%)

 **Liquid** Highly Voted 2 years, 10 months ago

Correct Answer: ABE

By default, pages that do not have the cache attribute set are cached for ten minutes (600 seconds). So it already defaults to cache=true and it will not have effect in page loading.

Only the components in the body of the are processed by the server, thereby increasing the performance of the page.

upvoted 9 times

 **Peter808** 1 year, 9 months ago

I think B is not required because the admin is using a single component

upvoted 2 times

 **Yas010101** Most Recent 5 months, 3 weeks ago

Selected Answer: ABE

In order to reduce the view state, make use of the following:

1. "Transient" keyword - to declare instance variables that can't be saved, and shouldn't be transmitted as part of the view state for a VF page.
2. Minimize the number of forms i.e <apex:form> on a page. Make use of <apex:actionRegion> instead of using 2 or more forms.
3. Refine your SOQL to retrieve only the data needed.
4. All public and private data members present in standard, custom and controller extensions are saved as a part of view state. so use transient variables which are not stored in state of page.
5. Instead of using <apex:commandlink> or <apex:commandbutton>, go for <apex:outputlink>

<https://help.salesforce.com/s/articleView?id=000384480&type=1>

upvoted 1 times

 **Sapphire808** 9 months, 1 week ago

Selected Answer: ABE

Addressing view state, rerendering, and optimizing SOQL will all improve page performance.

upvoted 1 times

 **Ting21** 1 year, 2 months ago

ans is ABE. for C I cannot find any documentation which says standard stylesheets in a page will affect the performance.

upvoted 2 times

 **lorenac2** 1 year, 6 months ago

Selected Answer: ACE

I reviewed the documentation, it is set to FALSE for INTERNAL users by default, hence, it needs turned on. If the question asked about customers, the default is TRUE, cache is already enabled.

Reference: https://developer.salesforce.com/docs/atlas.en-us.pages.meta/pages/pages_compref_page.htm

My guess is that B is not relevant because it explicitly states that it is a multi-page interface, so it is less likely there will be a need for re-rendering.

upvoted 1 times

A developer writes the following Apex trigger so that when a Case is closed, a single Survey record is created for that Case. The issue is that multiple Survey_c records are being created per Case. trigger CaseTrigger on Case (after insert, after update){ List<Survey_c> createSurveys = new List<Survey_c>(); for (Case c : trigger.new){ if (c.IsClosed && (trigger.isInsert || trigger.isUpdate && trigger.oldMap.get(c.Id).IsClosed == false)){ createSurveys.add(new Survey_c(Case_c = c.Id)); } } insert createSurveys; }

What could be the cause of this issue?

- A. A user is creating the record as Closed
- B. A workflow rule is firing with a Create Task action
- C. A workflow rule is firing with a Field Update action
- D. A user is editing the record multiple times

Suggested Answer: D

Community vote distribution

C (100%)

🗳️ **Sri_Vathsa** Highly Voted 3 years, 1 month ago

Answer is C. As the workflow field update, makes the trigger to run again, and in the same transaction instance, so trigger creates second record.
upvoted 7 times

🗳️ **Liquid** Highly Voted 3 years, 3 months ago

C. When a workflow's field update triggers a after update event. The Trigger.Old is still not "Closed". So it will insert a second record.
upvoted 5 times

🗳️ **Avinash_14** Most Recent 2 months, 4 weeks ago

C sounds more suitable.

While this could lead to the trigger firing multiple times, it wouldn't typically cause multiple Survey_c records unless the Case is reopened and closed again. However, the fact that the issue is consistent points more toward a system process, like a Field Update, than manual user behavior.
upvoted 1 times

🗳️ **tester1987** 1 year ago

lol how do we know we have a workflow rule in the system or user is editing the record multiple times. This is shitty question

It is not option D. The trigger fires only when it is case is changed from not closed to closed.
upvoted 2 times

🗳️ **rodmfpc** 3 years, 9 months ago

Adarsh168 The trigger fires when the case is changed to 'Closed' but it also fires every time a Case is inserted regardless it is 'Closed' or not. So the trigger is firing more times than expected.
upvoted 2 times

🗳️ **sf2022** 2 years ago

Trigger is fire multiple-time but only insert Survey_c when Closed, so D is wrong, C is correct
upvoted 1 times

What is a potential design issue with the following code?

```
trigger accountTrigger on Account (before update){ Boolean processOpportunity = false; List<opportunity> opptyClosedLost = new List<opportunity>() List<opportunity> lstAllOpp = [select StageName from Opportunity where accountId IN :Trigger.newMap.keySet()]; if(!lstAllOpp.isEmpty()) processOpportunity = true; while(processOpportunity) { for(opportunity o : lstAllOpp) if(o.StageName == 'Closed - Lost') opptyClosedLost.add(o); processOpportunity = false; if(!opptyClosedLost.isEmpty()) delete opptyClosedLost;
```

- A. SOQL could be avoided by creating a formula field for StageName in Account from the related Opportunity
- B. The code will result in a System.LimitException : Too many script statements error
- C. The code will result in a System.DmlException:Entity_is_Deleted error
- D. The code will result in a System.LimitException: Apex CPU time limit exceeded error

Suggested Answer: D

Community vote distribution

B (50%)

D (50%)

bsf_96 5 months, 1 week ago

Answer is D

If no opportunity is "Closed-Lost", code will infinitely loop resulting in Apex CPU time limit error

upvoted 1 times

FriedConsole2000 10 months, 4 weeks ago

Selected Answer: B

Shouldn't it be "B". Wouldn't this be an infinite loop if no stageName == 'Closed - Lost'?

upvoted 1 times

moitam 1 year, 4 months ago

Selected Answer: D

I will just add my 2 cents here...

The best option is D. The code will result in a System.LimitException: Apex CPU time limit exceeded error if the trigger is invoked with a large number of records. The other options are not correct because:

- A. Creating a formula field for StageName in Account will not avoid SOQL, it will just add an extra field to the Account object that may not be accurate or useful.
- B. The code will not result in a System.LimitException: Too many script statements error because the number of script statements is not dependent on the number of records processed by the trigger.
- C. The code will not result in a System.DmlException:Entity_is_Deleted error because the records are deleted only once and not queried again after deletion.

upvoted 1 times

lorenac2 2 years ago

I agree with it being a bad question. I can't tell where one code block begins and ends.

A is irrelevant

B is related to running too many lines of code, unlikely because a trigger runs in batches of 200

Maybe somehow it is C depending on how it is supposed to be written

D is also unlikely unless this ended in an infinite loop

upvoted 1 times

lorenac2 2 years ago

No, not C, C is when a different record is added or updated and is associated with a deleted record: <https://help.salesforce.com/s/articleView?id=000383970&type=1>

So then my guess is that this was supposed to end in an infinite loop; in short, a code block that loops and never meets the exit condition.

upvoted 1 times

  **lorenac2** 2 years ago

Here is a better format of the code in case someone else wants to compare:

```
trigger accountTrigger on Account (before update){
Boolean processOpportunity = false;
List<opportunity> opptyClosedLost = new List<opportunity>();
List<opportunity> lstAllOpp = [select StageName from Opportunity where accountId IN :Trigger.newMap.keySet()];
if(!lstAllOpp.isEmpty()){
processOpportunity = true;
while(processOpportunity){
for(opportunity o : lstAllOpp){if(o.StageName == 'Closed - Lost'){
opptyClosedLost.add(o);
processOpportunity = false;}}}
if(!opptyClosedLost.isEmpty()){delete opptyClosedLost;}
```

The design flaw is that neither loop is necessary, a proper query could have collected the correct records to begin with and then delete them.

upvoted 3 times

  **mageshrr** 2 years, 1 month ago

During testing, No Error was Found, in fact, the opportunity record was deleted successfully. Therefore, None of the answers listed are not matching. I am not sure whether the question is correct.

upvoted 1 times

The Contact object has a custom field called "Zone." Its data type is "Text" and field length is 3.

What is the outcome after executing the following code snippet in the org?

```
List<Contact> contactsToBeInserted=new List<Contact>(); Contact contactInstance= new Contact(LastName='Smith', Department='Tech', Zone_c='IAD'); contactsToBeInserted.add(contactInstance); contactInstance= new Contact (LastName='Sm1th', Department='Tech', Zone_c='PITT'); contactsToBeInserted.add(contactInstance); Database.insert (contactsToBeInserted,true);
```

- A. Both inserts succeed and the contact record that has the Zone value of 'PI'I' is set to NULL
- B. A partial insert succeeds and the contact record that has the Zone value 'IAD' is inserted
- C. Both inserts succeed and the contact record that has the Zone value of 'PITT' is truncated
- D. An unhandled DML exception is thrown and no contact records are inserted

Suggested Answer: D

Community vote distribution

D (100%)

 **drwebber** Highly Voted 1 year, 7 months ago

no contacts will be inserted:

A (50%)

D (50%)

🗳️ **FriedConsole2000** 4 months, 3 weeks ago

Selected Answer: A

"A" is the only one that could be true. It doesn't define "acc", so it could be true. "D" doesn't reference the method name.

upvoted 1 times

🗳️ **moitam** 10 months, 1 week ago

Selected Answer: A

I will go with option A for this one.

To call a method with an sObject parameter, you need to pass an instance of a specific sObject type, such as Account, Contact, or Opportunity2. Based on this, I think the correct answer is A. processList (acc), where acc is an instance of Account sObject.

Example:

```
List<sObject> myList = new List<sObject>();
myList.add(new Account(Name = 'Acme', Phone = '111-111-1111'));
myList.add(new Account(Name = 'Beta', Phone = '222-222-2222'));
```

```
static void processList(List<sObject> input) {
for (sObject obj : input) {
Account acc = (Account) obj;
System.debug('Name: ' + acc.Name + ', Phone: ' + acc.Phone);
}
}
```

processList(myList);

upvoted 3 times

🗳️ **Ronin192** 1 year, 7 months ago

Selected Answer: D

D is correct, tested and it gives no error

upvoted 2 times

🗳️ **skipper009** 2 years, 5 months ago

I think this is a poorly constructed question. But C makes more sense if only if it's Account instead of sObject.

upvoted 1 times

🗳️ **lorenac2** 1 year, 6 months ago

Agreed, bad question, again. SOSL always returns a list of lists even if only returning one object. I verified this.

upvoted 1 times

🗳️ **nibbio** 2 years, 7 months ago

Selected Answer: D

Correct Answer D, sObject is not supported on queries. the SOSL query returns a list of list of sObject so it cannot be the right answer.

upvoted 2 times

  **drwebber** 2 years, 7 months ago

Seems that something was missed in the answers.

BC is not correct answers, but there's no invocation of the processList method in D.

On the other hand, it's possible to name list as 'acc' (List<Account> acc;)

upvoted 3 times

A developer needs to design a custom object that will be integrated into a back-end system.

What should the developer do to ensure good data quality and to ensure that data imports, integrations, and searches perform well? (Choose two.)

- A. Configure a custom field as unique
- B. Configure a custom field as indexed
- C. Configure a custom field as external ID
- D. Configure a custom field as Salesforce ID

A developer is writing unit tests for the following method:

```
public static Boolean isFreezing(String celsiusTemp){ if(String.isNotBlank(celsiusTemp) && celsiusTemp.isNumeric())  
{ return Decimal.valueOf(celsiusTemp) <= 0; } return null; }
```

Which assertion would be used in a negative test case?

- A. System.assertEquals(true, isFreezing(null))
- B. System.assertEquals (true, isFreezing('0'))
- C. System.assertEquals(null, isFreezing('asdf'))
- D. System.assertEquals(true, isFreezing('100'))

Suggested Answer: C

 **loreac2** 6 months ago

This has always confused me. I thought negative testing was seeing if the returned value was something other than what was expected such as in B where passing null should return null not true. It seems that negative testing is about seeing if the code handles the bad input correctly, and return null in this case, so the assert should be C to make sure that it handles improper data correctly.

A customer has a single Visualforce page that allows each user to input up to 1500 sales forecasts and instantly view pivoted forecast calculations. Users are complaining that the page is loading slowly, and they are seeing error messages regarding heap and view state limits. What are three recommendations to optimize page performance? (Choose three.)

- A. Segregate calculation functionality from input functionality
- B. Specify the list of sales forecasts as transient
- C. Implement pagination and reduce records per page
- D. Create formula fields to compute pivoted forecast calculations
- E. Use JavaScript Remoting instead of controller actions

upvoted 1 times

Ting21 1 year, 2 months ago

ABD are all correct. AccountShare is child of Account. CaseComment is child to Case.

order is child to Account.

upvoted 1 times

cPickle 1 year, 2 months ago

Selected Answer: AD

A, D is Correct.

In option A, the "Account" object and "AccountShare" object are related to sharing records with other users, so it is common to perform DML operations on these objects in the same transaction.

In option D, the "Account" object and "Order" object are related to sales transactions, where an order may be related to an account. Therefore, it is also common to perform DML operations on these objects in the same transaction.

Option B, "Case" object and "CaseComment" object are related to managing comments on a case, but they are not related to each other through a direct relationship. So, they cannot be used together in the same transaction.

Option C, "Opportunity" object and "User" object are not directly related to each other, so they cannot be used together in the same transaction.

upvoted 1 times

GGJJ 1 year, 4 months ago

A developer must create a custom pagination solution. While users navigate through pages, if the data is changed from elsewhere, users should still see the cached results first accessed.

How can the developer meet these requirements?

- A. Use @Cache annotation
- B. Use a StandardSetController
- C. Use OFFSET in SOQL queries
- D. Use OFFSET WITH CACHE in SOQL queries

Suggested Answer: B

Community vote distribution

B (100%)

🗨️ 👤 **Liquid** Highly Voted 👍 3 years, 4 months ago

OFFSET is applied to the result set returned at the time of the query. No server-side cursor is created to cache the full result set for future OFFSET queries. The page results may change if the underlying data is modified during multiple queries using OFFSET into the same result set. As an example, suppose that the following query normally returns a full result set of 50 rows, and the first 10 rows are skipped using an OFFSET clause:

Selected Answer: B

Standard set controller with caching logic implemented

upvoted 1 times

🗨️ 👤 **Liquid** 3 years, 4 months ago

Pros

- Manages data sets on the server, which reduces page state and increases performance
- Allows you to paginate over large data sets that have up to 10,000 records
- Includes built-in functionality such as next, previous, first, last, getResultSize, and other methods that can simplify your page
- Allows you to paginate forward and backward or to any page within the result set
- Uses a server-side cursor to cache the entire result set, so results will not change if data changes in the database while a user is paginating from one page to the next

Cons

- Has built-in functionality that results in a very small increase in view state size
- Can be used only in Apex

upvoted 2 times

Which use case is an appropriate fit for the @future asynchronous Apex method? (Choose two.)

- A. A developer has jobs that need larger query results than regular transactions allow
- B. A developer needs to segregate DML operations and bypass the mixed save DML error
- C. A developer has long-running jobs with large data volumes that need to be performed in batches
- D. A developer has long-running methods and needs to prevent delaying an Apex transaction

A developer has written an After Update trigger on Account. A workflow rule and field update cause the trigger to repeatedly update the Account records.

How should the developer handle the recursive trigger?

- A. Deactivate the trigger and move the logic into a Process or Flow
- B. Deactivate the workflow rule to prevent the field update from executing
- C. Use a static variable to prevent the trigger from executing more than once
- D. Use a global variable to prevent the trigger from executing more than once

Suggested Answer: C

Community vote distribution

C (100%)

🗨️ 👤 **Sapphire808** 3 months, 1 week ago

Selected Answer: C

Deactivating the workflow rule would remove the logic that may still be needed. Moving it to flows and process builders could work but there are other options that would be easier to implement. A global variable is too broad.

A static variable will hold the value during the run of all processes that are triggered (during the threaded call) and will maintain its value in the context of this process.

upvoted 1 times

🗨️ 👤 **Liquid** 2 years, 4 months ago

A static variable is static only within the scope of the Apex transaction. It's not static across the server or the entire organization. The value of a static variable persists within the context of a single transaction and is reset across transaction boundaries. For example, if an Apex DML request causes a trigger to fire multiple times, the static variables persist across these trigger invocations.

To store information that is shared across instances of a class, use a static variable. All instances of the same class share a single copy of the static variable. For example, all triggers that a single transaction spawns can communicate with each other by viewing and updating static variables in a related class. A recursive trigger can use the value of a class variable to determine when to exit the recursion.

A company wants to create a dynamic survey that navigates users through a different series of questions based on their previous responses. What is the recommended solution to meet this requirement?

- A. Dynamic Record Choice
- B. Lightning Process Builder
- C. Visualforce and Apex
- D. Custom Lightning Application

Suggested Answer: A

Community vote distribution

🗨️ **beardAnt** 3 months, 1 week ago

Selected Answer: A

A Dynamic Record Choice is a query on an Object in Salesforce that you may add filters to, and have those results presented to your End User for selection. The records that you return will be dynamic based on your filters, and the End User can select one or multiple records to perform an action on.

upvoted 1 times

🗨️ **Sapphire808** 1 year, 3 months ago

Selected Answer: B

Process builder and if updated flow can get this accomplished easily. Nothing is mentioned of it being complicated that would require Visualforce and apex.

upvoted 1 times

🗨️ **cPickle** 1 year, 8 months ago

Selected Answer: C

C is Correct.

Visualforce allows you to create custom user interfaces using HTML, CSS, and Apex, and provides the flexibility to create dynamic surveys with conditional questions based on user responses. With Apex, you can define the logic to determine which questions should be displayed based on previous responses, as well as store and retrieve the survey responses.

While the other options listed may have some capabilities to address this requirement, Visualforce and Apex are the most suitable options for creating a dynamic survey with custom logic and navigation based on user responses.

upvoted 1 times

🗨️ **lorenac2** 2 years ago

I don't see A being a good answer. Ideally you would want to use flow, and although A is a piece of flow, it itself is not a complete solution. Of the options available, D would be best as it implements lightning components, which may have incorporated flow into it. However, it doesn't need to, it can stand alone and is better with being reactive and is better for mobile apps as well.

upvoted 3 times

Which statement is true regarding both Flow and Lightning Process? (Choose two.)

- A. Can use Apex methods with the @InvocableMethod annotation
- B. Are both server-side considerations in the Order of Execution
- C. Can use Apex that implements the Process.Plugin interface
- D. Are able to be embedded directly into Visualforce pages

Suggested Answer: AB

A developer wrote a Visualforce page for Sales Reps to add products to an order. The page takes a URL query parameter, productFamily, which filters the product results. The test method for the filter behavior has an assertion failing due to an incorrect number of results. Why could the test be failing? (Choose two.)

- A. The test does not call Test.startTest()
- B. The test does not create product data
- C. The test is not run by a System Administrator
- D. The test does not set the current page reference

Suggested Answer: *BD*

Community vote distribution

BD (100%)

 **lorenac2** 6 months ago

Selected Answer: *BD*

The question is written incorrectly. The question is implying that there are results, but there can't be if B is an answer. D is the other, it sets the page in context for the test to be able to set parameters.

Reference: https://developer.salesforce.com/docs/atlas.en-us.pages.meta/pages/pages_controller_error_handling.htm

upvoted 1 times

A developer writes the following code:

```
public with sharing class OrderController() public PageReference sendOrder() Order_c order = new Order_c insert order;
ExternalOrder externalOrder = new ExternalOrder(order); Http h = new Http(); HttpRequest req = new HttpRequest();
req.setEndpoint('https://www.example.org/v1/orders'); req.setMethod('POST'); req.setBody(JSON.serialize(externalOrder));
HttpResponse res = h.send(req); order = (ExternalOrder)JSON.deserialize(res.getBody(),ExternalOrder.class);
```

While testing the code, the developer receives the following error message:

System.CalloutException : You have uncommitted work pending

What should the developer do? (Choose two.)

- A. Use the `asyncSend()` method of the HTTP class to send the request in async context
- B. Ensure all callouts are completed prior to executing DML statements
- C. Move the web service callout into an `@future` method
- D. Use `Database.insert (order, true)` to immediately commit any database changes

Suggested Answer: BC

  **Liquid** Highly Voted  1 year, 10 months ago

ACD Record Type is not indexed
upvoted 1 times

🗨️ **Liquid** 2 years, 10 months ago

ACD

The platform automatically maintains indexes on the following fields for most objects.

RecordTypeId

Division

CreatedDate

Systemmodstamp (LastModifiedDate)

Name

Email (for contacts and leads)

Foreign key relationships (lookups and master-detail)

The unique Salesforce record ID, which is the primary key for each object

Salesforce also supports custom indexes on custom fields, with the exception of multi-select picklists, text area (long), text area (rich), non-deterministic formula fields, and encrypted text fields.

External IDs cause an index to be created on that field, which is then considered by the Force.com query optimizer.

External IDs can be created on only the following fields.

Auto Number

Email

Number

Text

To create custom indexes for other field types, including standard fields, contact salesforce.com Customer Support
upvoted 3 times

  **ncore** 2 years, 7 months ago

According to this, also E should be right answer as it is RecordType?

upvoted 1 times

  **nibbio** 2 years, 7 months ago

Nope, recordtype is not recordtypeid. Answer is: Name, SystemModStamp, LastModifiedDate

upvoted 2 times

How long is field history retained?

- A. 18 Months
- B. 12 Months
- C. 24 Months
- D. 6 Months
- E. 36 Months

Suggested Answer: A

  **beardAnt** 3 months, 1 week ago

When Field Audit Trail is enabled, Field History Tracking no longer enforces the 18-month retention limit. Without Field Audit Trail enabled, Salesforce deletes field history data after 24 months. :/

https://help.salesforce.com/s/articleView?id=release-notes.rn_general_field_tracking_retention.htm&release=238&type=5
upvoted 1 times

  **Liquid** 3 years, 4 months ago

Field history data is retained for up to 18 months through your org, and up to 24 months via the API. Field history tracking data doesn't count against your Salesforce org's data storage limits.

Choose the correct definition for <apex:pageMessage>.

- A. Standard Salesforce formatting, throws a specific message on a page
- B. Standard Salesforce formatting, shows all errors that occur on page. Can add more messages through the "ApexPages.addMessage" function
- C. A single message, without formatting, that can be associated with a specific component on the page
- D. No formatting; displays all errors on a page

Suggested Answer: A

Community vote distribution

A (50%)

D (25%)

B (25%)

🗨️ **rufusroffie** 4 months, 1 week ago

Selected Answer: A

this article explains difference between message and messages.

<https://www.sfdcpoint.com/salesforce/apexpagemessage-and-apexpagemessages-salesforce/>

upvoted 1 times

🗨️ **DJShetty** 4 months, 2 weeks ago

Selected Answer: A

A is correct.

apex:pageMessages is the component where you can add multiple messages and it shows all the errors with formatting i.e. It displays all the messages that were generated for all components on the current page with formatting.

apex:pageMessage is used to display single message i.e. it shows the specified message with formatting.

apex:messages is similar to apex:pageMessages i.e. it shows all of the errors but with no formatting i.e. All messages that were generated for all components on the current page will be displayed without formatting.

apex:message shows only the error for the specified field i.e. it is used to display message for a specific component.

A is the correct ans
upvoted 1 times

 **singhkar** 2 years, 1 month ago

B is the correct ans ..please ignore previous comment
Below in the reference

https://developer.salesforce.com/docs/atlas.en-us.pages.meta/pages/pages_compref_messages.htm

upvoted 1 times

 **drwebber** 1 year, 6 months ago

The answer is D

All messages that were generated for all components on the current page. If an <apex:message> or <apex:messages> component is not included in a page, most warning and error messages are only shown in the debug log.

upvoted 1 times

Choose the correct definition for <apex:message>.

- A. Standard Salesforce formatting, throws a specific message on a page
- B. Standard Salesforce formatting, shows all errors that occur on page. Can add more messages through the "ApexPages.addMessage" function
- C. A single message, without formatting, that can be associated with a specific component on the page
- D. No formatting; displays all errors on a page

Suggested Answer: C

Community vote distribution

C (100%)

🗨️ **DJShetty** 4 months, 2 weeks ago

Selected Answer: C

Single message without Salesforce formatting styles would be choice 'C'.

apex:message shows only the error for the specified field i.e. it is used to display message for a specific component.

apex:pageMessage is used to display single message i.e. it shows the specified message with formatting.

upvoted 1 times

🗨️ **ncore** 1 year, 7 months ago

It can be formatted therefore I would say A is more correct

```
<apex:message for="Location_validation" styleClass="locationError" /> <p />
```

```
<apex:message for="Employee_validation" styleClass="employeeError" /> <p />
```

upvoted 2 times

Choose the correct definition for <apex:actionFunction>.

- A. Allows for controller methods to be called directly from Javascript. Must be encapsulated in <apex:form> tags. Unlike actionSupport, these function<apex:actionPoller>s can be called directly from Javascript code
- B. Sends an AJAX request according to the time interval you specify. If this ever gets re-rendered, it resets
- C. Adds AJAX support to another component (e.g. onClick, onMouseUp, onFocus, etc.)
- D. Can be associated with an AJAX request (actionFunction/actionSupport/actionPoller) and shows content conditionally depending on the status of the request (in progress/complete). Use the "id" field to specify name; use "status" field on related components to connect them
- E. Signifies which components should be processed by the server when an AJAX request is generated

Suggested Answer: A

Code must have X% overall code coverage.

- A. X = 100
- B. X = 75
- C. X = 65
- D. X = 50

Correct Answer: *B*

All triggers must have at least 1% code coverage

Currently there are no comments in this discussion, be the first to comment!

How would you test a web service?

- A. Use the `@future` annotation on the method
- B. Call the `WebService` interface
- C. Web Services do not need to be tested
- D. Create a class that implements the `WebServiceMock` interface

Correct Answer: *D*

Write a fake response in the `doInvoke` method. Mark this class with an `@isTest` annotation. That way, it gets excluded from your org's size limit in test method, call

```
Test.setMock(WebServiceMock.class, [mock class name])
```

Which of the following about Dynamic Apex is incorrect?

- A. You can retrieve the sObject type from an Id by calling `.getSObjectType()`
- B. `getDescribe()` can get you a variety of info on a particular object/field
- C. `Schema.getGlobalDescribe()` gives you a map of all sObject
- D. In dynamic SOQL, you can use bind variables and bind variable fields

Correct Answer: *D*

While you can use simple bind variables in dynamic SOQL, you cannot use bind variable fields (e.g. `:myVariable.field1_c`)
Use `escapeSingleQuotes` to prevent SOQL injection

Which of the following exceptions cannot be caught and will force an error? (Choose three.)

- A. LimitException
- B. AssertException
- C. SObjectExceptions
- D. DMLException
- E. License exceptions
- F. ListException

Correct Answer: *ABE*

SObjectException occurs when accessing a field not queried, or you try to change a field during the wrong dml statement (i.e. an edit-only field being set on insert)

Custom exceptions must extend the "Exception" class

If you wanted to create a record following the update of another (with data from the source object), what is the most customizable approach?

- A. Workflow Rule
- B. Process Builder
- C. After update Trigger
- D. Flow

Suggested Answer: B

Community vote distribution

D (50%)

C (50%)

🗨️ **FriedConsole2000** 4 months, 3 weeks ago

Selected Answer: D

I think they want the answer to be "D"
upvoted 1 times

🗨️ **[Removed]** 10 months, 2 weeks ago

Selected Answer: C

If the question is about the 'most efficient approach', then D would be the correct answer. However, since this question specifies the 'most customizable approach', C should be the right answer.
upvoted 1 times

🗨️ **OmShantiVeg** 1 year, 11 months ago

C may be the ans as it says most customizable
upvoted 2 times

🗨️ **suddeb** 2 years, 3 months ago

I think the answer should be D. Salesforce recommends Flow as Process Builder is going to decommission or not preferred/best practice approach.
upvoted 4 times

🗨️ **ncore** 2 years, 7 months ago

I struggle to understand how Process could be more customizable then code in apex trigger
upvoted 1 times

🗨️ **OmShantiVeg** 1 year, 11 months ago

Agreed still D should be the ans I guess
upvoted 2 times

What is the correct order of execution for Visualforce Page "postback" requests (when user interaction requires a page update)?

- A. 1) Decode View State 2) Evaluate expressions and method calls for the main page and custom components 3) Upon successful completion, Evaluate the action that triggered the postback 4) Upon successful completion, Update data and redirect user/update view state 5) HTML sent to browser
- B. 1) Evaluate expressions and method calls for the main page and custom components 2) Decode View State 3) Upon successful completion, Update data and redirect user/update view state 4) Upon successful completion, Evaluate the action that triggered the postback 5) HTML sent to browser
- C. 1) Decode View State 2) Evaluate expressions and method calls for the main page and custom components 3) Upon successful completion, Update data and redirect user/update view state 4) Upon successful completion, Evaluate the action that triggered the postback 5) HTML sent to browser

Correct Answer: A

Currently there are no comments in this discussion, be the first to comment!

The "action" attribute on <apex:page> is ONLY evaluated on which type of request?

- A. Get request
- B. Postback request

Correct Answer: A

Currently there are no comments in this discussion, be the first to comment!

If the "PageReference.setRedirect" Apex function is set to True, what type of request is made?

- A. Get request
- B. Postback request
- C. If PageReference points to the same controller and subset of extensions, postback request, otherwise get request

Suggested Answer: A

🗨️ **vm1406** 2 months ago

You can use the setRedirect attribute on a pageReference to control whether a postback or get request is executed. If setRedirect is set to true, a get request is executed. Setting it to false does not ignore the restriction that a postback request will be executed if and only if the target uses the same controller and a proper subset of extensions. If setRedirect is set to false, and the target does not meet those requirements, a get request will be made.

upvoted 3 times

🗨️ **Liquid** 1 year, 4 months ago

This type of redirect performs an HTTP GET request, and flushes the view state, which uses POST. If set to false, the redirect is a server-side forward that preserves the view state if and only if the target page uses the same controller and contains the proper subset of extensions used by the source page.

Note that if the URL of the PageReference object is set to a website outside of the salesforce.com domain, or to a page with a different controller or controller extension, the redirect always occurs, regardless of whether the redirect attribute is set to true or false.

upvoted 1 times

If the "PageReference.setRedirect" Apex function is set to False, what type of request is made?

- A. Get request
- B. Postback request
- C. If PageReference points to the same controller and subset of extensions, postback request, otherwise get request

Correct Answer: *C*

Currently there are no comments in this discussion, be the first to comment!

When should you use the "transient" property on variables?

- A. Variables that you want transmitted as part of the view state. Static variables also don't get transmitted
- B. Variables that you don't want transmitted as part of the view state. Static variables also don't get transmitted
- C. Static variables that you want transmitted as part of the view state to save space
- D. Large variables in order to save space

Correct Answer: *B*

Within the System.Limit class, what would you call to get the number of calls made in your transaction?

- A. get[typeOfLimit] --> (Ex. getDMLStatements())
- B. getLimit[typeOfLimit] --> (Ex. getLimitDMLStatements())

Correct Answer: A

Currently there are no comments in this discussion, be the first to comment!

Within the System.Limit class, what would you call to get the total limit you can call in a single transaction?

- A. get[typeOfLimit] --> (Ex. getDMLStatements())
- B. getLimit[typeOfLimit] --> (Ex. getLimitDMLStatements())

Correct Answer: *B*

Currently there are no comments in this discussion, be the first to comment!

Universal Container needs to integrate with an external system. Every time an Account record is updated to meet certain criteria, a SOAP message must be sent to a third party end-point with the following information: Name, Industry, AccountNumber, and Rating. The lead developer for the org is considering using Workflow rules instead of Apex triggers to fulfill the above requirements. What are three benefits of using Workflow rules as opposed to Apex triggers? (Choose three.)

- A. A SOAP message can send more than 100 notifications
- B. Two-way SSL is supported by including a client certificate
- C. Outbound messages prevent circular changes out-of-the-box
- D. Retry logic for outbound messages is enabled out-of-the-box
- E. Tracking outbound message delivery is enabled out-of-the-box

Suggested Answer: ABC
